I don't think so. The closest rose node would be down in
Pauls Valley, but I'm sure all that has gane away. It'd be too
far from where I am, and over the hill.

Legally, ham operators aren't allowed to encrypt the
data they transmit over amateur wavelengths, if I
understand it correctly.

I'm curious about what happens if you want to connect
to a machine that only allows encrypted connections
such as ssh or a VPN.

I'm thinking of getting my license for the purpose of digital communications. (I've never had any interest in seeing if I can talk to someone in every country or anything like that.)

But as a grad student at Texas A&M (one of the oldest at the moment, I suppose) I would like to be able to connect to A&M via the university's VPN service. But that would encrypt all communications over the link.

What's the status on that? Are there any exceptions for cases when you really can't get around it?

Oh, q15x25 that does bring in a few search records...

I suspect the intent is to transfer data at the maximum speed allowed, and to do it without retries.

I haven't kept up with the technology, but is 15 tones authorized? I guess anything's fun when it's new, which might be the attraction.

Charles,

Until I very recently acquired a new notebook I had Windows 95, NBF, Flexnet32 and the old TNC2c with 6PACK in it running fine for a long time.
This seems to be contrary to your experience.

Before that I used the version of Flexnet that needs to be loaded in AUTOEXEC.BAT. I changed to Flexnet32 as soon as I found out about it. The documentation is pretty scant and I remember difficulties in getting it to work at first. I found out that some DLL or another needed to be put in the directory of the other programme (when considering NBF and Flexnet32), but I'd have to look in the old notebook at home to find out which file and where I put it.

My old notebook was a Tulip ml/sb with 32 Mb RAM and 133 MHz.

I have now been using NBF and AGWPE and Smack KISS mode on the TNC. It works mostly, but maybe there is still a problem with it. It seemed like NBF and AGWPE had stopped working this morning. After restarting NBF a few times, AGWPE told me to restart the computer, too, which I did. However, the station I was connected to seems to have 'vanished' during the night, so maybe that caused the problem. It's hard for me to tell.

BTW, the USB serial adapter that Jarkko mentions is very expensive. Over $200 with 4 ports. Mine came with the HP Omnibook (type MT-60?-?). The driver I use is the latest from HP.

Hello there.

Does anyone know of a good packet radio program suitable for HF/VHF packet,
for Windows NT/2000/XP. One that will work via the soundblaster, with the
PTT either done via VOX or using the parallel or serial port.

The only program I have come accross that does software packet for windows
is AGWpacket, but that dont work under NT/2000/XP.

I have had a look at several ham web sites that list such programs, but they
always have busted links :-(

If you mean free, probably no. But there's some good products if
you are willing to part with money, there's www.mixw.net

Have you tried that, or are you only looking for free stuff?

Thanks Steve.

The MixW software seems to be very suitable, and most definately worth registering.

Hi:

I would like to be able to use my sound card as a digital ac voltmeter.
I would like to be able to measure ac volts at frequent intervals, and
save the results to a file. Does anyone know of any programs or any way to
do this?

Please reply by e-mail, because I don't read this newsgroup often.

Chuck

Hello everyone,

My sysop here on a local bbs has started again an hf gateway on 29.250FM
1200 baud. We are searching for other bbs's to start using this gateway to
forward messages from/to other bbs.

If you want to do so, please contact my sysop to his ax.25 adress :
sv2rq@sv2rq.tsl.grc.eu
or to his e-mail: sv2rq@otenet.gr

I believe its still a very nice AMATEUR way to communicate...I believe that
we should not let it die, like some think...

I dont agree with you my friend...

I am working with the AGW programs (BBS, Forward, Terminal) on Windows 2000
Pro and they are doing 100% ok. I dont work all programs on Windows XP, but
packet engine runs ok here also.

Have you tryied Winpack ?

Hi Ken

You are right! The KAM XL and the SCS PTC II line of TNC's are the ONLY TNC's that implement PSK31. I don't think you will find a TNC cheaper than a KAM XL.

(Don't be fooled! The Timewave PK232 TNC's do NOT support PSK31. But you can get a sound card interface that mounts inside the TNC for the sound card modes. But it is only a sound card interface. For portable use, it would be easier to bring with you a simple sound card interface than a PK232 with a sound card interface built in)

You may want to try the new 32 bit version of Flexnet for Windows and a soundcard. Apparently it works great under Win 95/98 but I do not know about NT/2000/XP

Looks like I found the program suitable for my needs. MixW seems to be a good alround program for everything, well for my uses Packet, SSTV and PSK.

Thanks for everyones help.

Maybe Hamish tried to tell that the more recent gnu/linux versions do very well in supporting sound hardware. Even the obscure hardware in portable computers can do audio. Yes, it has been different in the past.

Combined with your statement about user interfaces ... did you try a recent gnu/linux distribution, or are you repeating an old mantra ?

There seems to be plenty of software for this sort of thing on download.com
and shareware.com. Software for use as AC voltmeters, scopes and spectrum
analyzers. I don't know if any would be suitable for your needs.

I suppose once you found a suitable program you would have to calibrate it
against a known source, as each make of sound card is different.

Ah the mining is going to be in Cornwall, which is 150 miles from me. I guess our local news is a bit too local!. It hasn't been on the national news either here.

Thanks for the info.

I consider these ecowackos terrorists. Remember those forest fires a few months back out west? Why was that? Because those green wackos wouldn't let anyone clean out the underbrush. And if ANY sort of clearing was to be done to help break up fires they took em to court.

Got no use for them at all.

Dan/W4NTI

Hi!

No more speculation about the encoding scheme used. Looking further at the same archive, things come clear.

The files were generated by BIT-MACHINATOR, a conversion program written exclusively for the C64 computer. The manuals for this stuff can be found in the archive. Also you can get the very dXXXXd thing, but it was sent encoded by itself! :(

So the question now is: anybody knows where can I find "BIT-MACHINATOR" for C64, or at least a technical description of its workings???

Hopelessly,

Jesus, EA7HAC

I have an ICOM-718 HF xcvr. I just bought a RASCAL model R-IC13 to go with it. Hooked everything up, launched WinPSKse 2.2, configured the software and thought I was ready to go. Receive worked wonderfully, but I could not transmit.

WinPSK is configured to use RTS/DTR on com1, the cable is hooked to the com port, and the red LED on the RASCAL does light, but the IC-718 does not switch to TX mode. I checked with an ohm meter, the RASCAL is grounding pin 3 of the 13 pin din accessory plug. I also tried VOX mode without success.

The IC-718 does go to tx mode with the PTT switch or the key, so transmit is not inhibitted. I assume that I have a menu setting wrong, but I'll be darned if I can find it. I sent K4ABT an e-mail, he tried to help, but not much luck. Not his fault, he can't be familiar with every single radio out there.

I hope someone out there can rescue me!

Thans in advance,
Don, WA3KGT

Red Hat 7.5 soundcard software is still shit. Don't know about 8.0,
but I don't buy even number releases.

Hello,

Just dusted off my aea dsp 2232 which has not been used since AO-13 burned up.   It is an original from AEA and has PC Pakratt for windows version 2.0 software.   I have looked and not found other software that will work and is better. I have been using the sound card and MixW for over 2 years, but would like to try Pactor and use the 2232 as long as I have it. I am also using windows XP.   Thanks in advance.

Bert

HI Bert,

I think you will find that the old PC Pakratt for Windows software is pretty good for the 2232. But if memory serves me right, there was a Y2K bug in version 2.0. If you set the clock back in your PC you should be okay.

There are some newer programs out there such as "PKTerm" and "XPWare". Search google for the links.

Unfortunately, most the PC software is commercialware. There are not too many free software programs for the older TNC's. I wonder whether it is worth spending the money considering that many hams are now using the so called "sound card" modes not directly supported by the 2232 such as PSK31, MT63, MFSk etc. To my knowledge, AEA/Timewave really have not put much effort into upgrading the firmware in the old AEA TNC's. I believe that they could add some of the new modes to their DSP modems but they have chosen not to do so. (After all wasn't that the selling point of the AEA DSP TNC's -- to be able to easily add new digital modes using DSP?) .

Yes, the 2232 does support Pactor 1 but many hams have already upgraded to Pactor II or Pactor III which is only available with SCS modems. If you really want to get back into Pactor, I think it would be a better idea to save your money and buy a SCS PTC IIe or II Pro. Pactor II/III are fantastic. Quite an improvement over Pactor 1. There is also a GREAT hostmode terminal program available for the SCS modems called Alpha. Best of all it is FREE!

Rob

Yeah, it might be self-executing. Put it on
a virtual C64 floppy and "load "filename",8,1" it.

Oh that brings back memories the user friendly C64 syntax, not!!
It was something equally horrible just to get a directory of what was on the
disk, was it 'load "*",8,1' or something? And it was all 'pokes' and 'peeks'
just to get the thing to do graphics and colour.
But it was very good for ham software.

my AEA IDR-96 appears to be a pk-96 packet TNC with a built in UHF radio. The manual even calls it a pk-96 in places and says it's 1200/9600. I've searched the web and found references to both theories, that it's 9600 only or that it's both. If it can do 1200, how do I switch it to that mode? I haven't asked timewave, it's not even listed in the obsolete category. I think it's circa 1997. Thanks .

Thanks Rob,

I guess I really do not know what I want to do. I use to use the old 2232 a lot. I used it a lot on the digital satellites. I can tell some pretty harry stories about the tnc. I live about 40 miles from the original AEA in Lynwood, WA. Evan though they was the manufacture, they did not know any thing about how it works. There was one tec there that knew it pretty well. No one there worked sats and all except the tecs had a hell of a attitude about customer relations. I guess that is why they are no longer in business. I was in there so much, I was calling everyone by their 1st names.   Thanks again and I will do some searching again,

I have looked and not found other software that will work and is better. I have been using the sound card and MixW for over 2 years, but would like to try Pactor and use the 2232 as long as I have it. I am also using windows XP.   Thanks in advance.

load"*",8,1 loads the first file on the disk, load"$",8 folled by a LIST
will give you the contents of the disk. C64s had fun stuff with that
user port, my dad did some intersting halloween displays with either the
vic20 or the c64 running the show (hit mat, start synthesiszer, all that
kind of fun stuff).

Bert,

The 2232 is a great modem for satellite use (as well as the older digital modes such as RTTY and Pactor 1). It is still sought after by many satellite hams. You should still be able to get a good $ for it on Ebay if you ever decide to sell. If you decide to keep it, you may want to check out www.timewave.com and make sure you have the lastest AEA firmware for the 2232. (Timewave bought out AEA and still sells the latest firmware)

But if you really want to experience the the great new ERROR free ARQ modes of Pactor II and Pactor III, you will need to get a scs modem (see www.scs-ptc.com)

Hi, Steve:

Guess you know it, but I've just got an answer from Tihomir, 9A4GL. He tells
me doesn't have this stuff for at least 10 years.
So I'll try to recover "Doctor DX" from an 14 years old tape I have.

Many thanks es 73,

Jesus, EA7HAC

About 2 wks. ago I downloaded a small program from ??? that saves the sound card settings once you get everything setup. It worked well.   I do not know the name of the program or where I got it.

Unfortunately I had another pc problem and trying to reinstall win. xp I ended up formatting and reinstalling everything. My latest backup did not have this program.

Does anyone know of this program? If so please let me know where I can download it.   Thanks in advance.
Bert

Here's a site that reviewed the Rat Shack GPS:

http://www.gpspassion.com/Hardware/Reviews/RSGPS.htm

I plan to pick one of these up today, for immediate use with my iPaq.
Eventually I want to use it for APRS, so I'll re-post if I get that working!

Not recently, but I did have a IC-730 a ways back, and it worked
fine for RTTY. (I don't have it anymore. I gave the radio to my brother.)

I even used it for Pactor even though people said
the radio was too slow for Pactor. My recollection was that I just
wired my PK232 to the accessory jack on the back and it just worked.

Hi !

Using my TV card receiver,
I received on 163.5 MHz (in France)a audio stream...

I did not identify the 'encoding' type
FAX ? SSTV ? RTTY ? ...

I tried a lot of thing to see what's about...

May be you can help me listening to this mp3 ?

http://membres.lycos.fr/ripper/unknownsig/Signal.mp3

And the way I have to go to decode this...

Thanks a lot..

Gede.

No one expects.... uh never mind ;-)

On a serious note, I looked at that page and used the FCC ID# to look
up the certification and found a complete block diagram and schematic
of the base and handset; the phone doesn't appear to be scrambled at all,
it's compandored using an off-the-shelf Toshiba chip.

It's just wideband FM-modulated compandored analog. I wouldn't
use it at my house.

MP3 is not a good way to record data signals, because
much of the information content is inaudible to humans,
and is thus discarded by MP3. A few seconds of an
uncompressed format (e.g. WAV) would be a lot easier
to analyze.

With that said, you've captured a data signal. It appears
to be quaternary FSK, with a bit rate on the order of
9600 bits per second. I'd guess that it's paging data,
possibly FLEX.

I'll give you $5, you pay shipping. I need the power supply
too. Also, since these are worthless with a pair of them, I
need both. OK, $6.00.

Thanks!

Hi Laura,

Of course I know that MP3 is not the best format to analyse
data, and my TV card is not the best receiver to get
stream data ! :)
I just wanted to know...
Thanks a lot for your help...
I tried to decode with Acar program, but my reception quality
is realy too poor ! Maybe it should be better near Vancouver...

See U

I am just getting starting with some of these digital modes - namely, PSK31.
I have installed Hamscope V1.51 (Win XP) and have a minor problem. I am NOT
using any other logging program (maybe later) and have NOT entered any
information into the Setup so I expected to be able to click the "Log It"
button and have the info stored in a file. The Help file seems to indicate
this should work. The program never asks for a file name and seems to do
nothing. A search of the drives failed to find any new files. Nothing shows
up in the INI files or the Registry.

Other than this minor anomaly the program seems to perform as advertised. Any help would be appreciated including comments to redirect this question elsewhere.

TIA

Ron AK4RF

Hi All

Trying to setup kernel 2.4.19, soundmodem-0.7, ax25-tools-08 ax25-apps-06 & libax25-10 on a SuSE 7.1 distribution that has had lots of changes!

Have a problem with the PTT on the serial port /dev/ttyS0. No it isnt the short tx or non work of a year ir so back. The PTT (RTS etc) line goes high as soon as soundmodem is loaded or the soudnmodeconfig utility is put into diag mode.

It is resolving packets perfectly on RX and it makes the right TX noises. Only the PTT is the problem. I haven't tried the parallel port cause I need it for other things...

QSSTV and other serial devices work perfectly.

The kernel was actualy compiled with the kernel mode soundmodem but I diidnt insmod the modules.

Any thoughts, ideas?

Cheers Bob VK2YQA

Look at:

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=1394060883&rd=1

Equivalent of an IBM XT with 512 KB RAM. MSDOS 3.3 and PIM software in
ROM.
Runs for weeks on two "AA" alkaline batteries. Two PCMCIA Type I slots
for SRAM memory cards. PCMCIA flash
memory cards can be written in another computer and used as read-only in
the Poqet Classic. MDA and CGA B&W screen.
No scratches on screen. I will include a connector for the rear
proprietary connection so you can make your own serial
adapter. Great for Ham Radio packet. Here are some more specs:

Size: 8.8" x 4.3" x 1" 22.3cm x 10.9cm x 2.5cm Weight: 1.2 lb (0.54 kg)
w/batteries Battery life: 50-100 hours (about 2-3
weeks) Microprocessor: 80C88 / 0-8Mhz Memory: 640 KB SRAM Display:
reflective DSTN (no backlight) Display
compatibility: MDA: 80 x 25 characters CGA: 640 x 200 pixels PCMCIA:
2-Type I, Revision 1.0 memory card slots SRAM
cards must operate a 3.3v Does not support Revision 2.0 modem and
network cards. Secondary storage: Drive A: 512 KB -
2 MB PCMCIA (not included) Drive B: 512 KB - 2 MB PCMCIA (not included)
Drive C: 768 KB ROM drive with
MS-DOS 3.3 and PoqetTools Drive D: 22K volatile RAM drive Built-in
software: MS-DOS 3.3, PoqetLink, and PoqetTools

Anybody have any success with Flexnet under Windows XP?

I changed to a new notebook running XP from one running Windows 95.
The new computer (HP5179) has no built-in serial port, but a USB to
serial adapter was provided.
On the old notebook the packet setup worked fine: NBF packet mail
program, Flexnet, TNC2c with 6PACK firmware.

The USB to serial adapter on the new computer works OK with the other
serial connections I tried ((1) my satellite tuner and (2) my TNC in
TF2.7b/WA8DED Terminal mode with Hyperterminal on the PC). The TNC is

the same, so is the serial cable.

However the Flexnet parameter screen keeps showing a question mark in
the icon for the channel I set up; it doesn't work. Flexnet Control
locks up when I make changes to the parameters (set them up anew).

Will I really have to go back to WA8DED hostmode on the TNC2c to make
it work?

If there is a dedicated group for Flexnet, I haven't found it, so
please inform me.

Tnx and 73,
Arjen

I have only used it for test purposes, but Flex32 works ok for me with
WinXP. However, it only works with standard COM ports, I cannot persuade
it to work with my Belkin F5U103 USB adapter.

There is a FlexNet mailing list at http://www.qth.net that has been around for quite a while. It is mentioned, by the way, at the FlexNet web site.

There is also a FlexNet support forum at http://www.uspacket.net .

I started up both the list and the forum. - But haven't tried to run FlexNet on Windows XP yet. I'm still using Win98SE. When this computer fries, I imagine I will upgrade to XP, or whatever is current at the time.

By the way, I hear a rumor that the next Microsoft OS will no longer be called "Windows" at all. Don't know if it's a new system or just a name change. Guess we'll find out, sooner or later.

Good luck!

We have solution to control marine band radio in whatever distances.

One of our overseas project is suppling a VHF base station full duplex with DSC on transmit and receive and facilities to receive GMDSS signals. The remote controls of these radios need to control the radio from 600, 700, 4800 meter distances.

The controler can listen to radio all the time, it's possible to
listen to many channels at a same time.

to obtain more information about our company look at our website on

Thanks Roger!

So I'll have to go back to the future many years and reinstate Nordlink's TF2.7b in my TNC or build/buy new hardware perhaps??

I think the options of that firmware were 'Hostmode' or KISS. I can't remember having much lasting success with those under Windows 95, though.

Next question: What packet mail software works under Windows XP with either of those with any success?

I have shown the serial connection through the USB-adapter to work OK
with the TNC2c in Terminal mode, so there is some hope, but under
Windows 95 the (standard) serial port on my old notebook couldn't really
handle HOSTMODE over any extended period of time. I then tried KISS and
BPQ (?) for a while, but somehow that wasn't satisfying either. It's so
long ago I can't remember very well, but it was a struggle. Flexnet
solved it, but here we are, back at the start.

WinPack will work with TF2.7b in host mode, but the continuous TF host mode polling loop is a severe stress test for a USB adapter!

Why not use AGWPE? It works fine with TF2.7b in KISS mode. You can then use WinPack with it, or several other packet programs.

I know the KAM XL and the SCS TNC's were all there was last year in the wy of TNC's that could handle PSK31; are there any more offerings ths year? (preferably cheaper?)

I also know that the Windows programs using the sound card are better than a terminal emulator and a TNC. Hi-ever, this is for backpacking and a TNC with PDA are lots smaller and less power hungry than a lapop PC.

Sedgewall are specialists in the design and manufacture of electronic
sub system and modules for the telecommunications, defence and
emergency services market.

The company has gained a wide knowledge in the field of sub-contract
manufacture and assembly, from simple cable harnessing to equipment
capable of sensing abnormalities in air down to 1ppm.

I am using TM D700A and using it in Packet mode,
I am receiving GPS data of remote location from serial port on my pc
through built in TNC of TM D700A.
The data received is in Mic-E format ,I want to convert it back into
$GPGGA format,
Will any body tell me how to do,
Thanks a lot in advance.
Nauman.

I tried it yesterday and it worked with the adapter under XP, but as the
BBS station OH2RBI suddenly went off the air, I couldn't test it any
further.

> Why not use AGWPE? It works fine with TF2.7b in KISS mode. You can then
> use WinPack with it, or several other packet programs.

I remember KISS mode always getting a bad press, so I didn't regard it as a serious possibility and AGWPE is also something I tried in earlier years and ditched because it didn't work too well in my setup at the time (WIN95, TNC, TF2.7b).

I also tried NBF with the TNC running TF2.7b (hostmode) and it did not work with my USB-serial adapter. This is the application I've been using for many years now with Flexnet. Under XP neither works, at least not over the adapter.

PAXON, which is all new to me, seems to work fine over the adapter with TF2.7b, but it doesn't seem to provide the functionality I was looking for (which WinPack and NBF have). It's just a terminal program and has no provision for storing messages etc.

So, next I'll download AGWPE.

It seems some programs don't handle the serial port like it should be handled, otherwise they would work with the adapter. I know some programs work with it, so there is a way to do it right.
Or am I wrong here?
The only programming I do nowadays is in SAS and there one doesn't need to handle serial ports. I should probably be thankful for that ;-)

If you configure it correctly, which is pretty easy if you're using a
TNC, then it should work fine with your TF2.7b.

>It seems some programs don't handle the serial port like it should be
>handled, otherwise they would work with the adapter. I know some
>programs work with it, so there is a way to do it right.
>Or am I wrong here?

If a Windows program accesses a COM port via the Windows API, then it
should have no problem with a properly functional USB adapter. If it
handles it some other way, then it may well have problems.

Also, USB adapters tend to be buggy devices. The Belkin F5U103 is the
best I have found, but when I have tested it with TF host mode, I
occasionally get dropped characters if the PC is busy, and then the
program has to resync.

Thanks Roger.
I have been trying out PAXON with the TNC in HOSTMODE and I've seen no
resyncing problems, yet. (There is an indicator for this.) This may be
surprising, but I'm happy with it ;-)

I tried AGWPE last night, too, and put it to work with the TNC in
SMACK/KISS. Worked, but I had some crashes. Reminds me of earlier
versions of AGWPE that I tried years ago.
The power saving setting may have caused the troubles I experienced with
AGWPE after my notebook has gone into hibernating. I have changed the
power saving profile now.

BUT, unfortunately my local BBS OH2RBI has suddenly gone off the air.
It'll be back, I suppose. It has been off the air before without a
warning and it has always come back after a while.
However for that reason there isn't much traffic going on just now.

73,

I find I got resync problems with the USB adapter when the PC is very busy doing something else, for example compiling a program, but I do not get the same problem with a "normal" COM port.

>I tried AGWPE last night, too, and put it to work with the TNC in

I run AGWPE 24/7 with three TNCs, without any problem, and I know lots of other hams also run it for long periods without problems.

>The power saving setting may have caused the troubles I experienced with
>AGWPE after my notebook has gone into hibernating.

Yes, that sounds like it could be the cause of your troubles.

Hello, All!

Newest beta- version of my TrueTTY sound card software can work as KISS-TNC emulator. I am very interesting in beta-tester reports.

You can get TrueTTY 1.95b from
  http://www.dxsoft.com/truettyb.zip or
  http://www.hamport.com/truettyb.zip

WBR,
 Sergei

Maybe I'm misreading it, but it looks like the Timewave implementation
of PSK31 is via built-in PC sound card interface. You still need a PC
to encode and decode the audio.

I'm not sure what that means, other than they put in a couple of
isolators.

The ones I mentioned actually encode and decode PSK31: i.e. they take
an audio PSK31 signal from your radio and convert it to ASCII they
pump up the RS-232 cable, and vice versa.

PSK does not use a TNC. The RX & TX audio from the radio are connected
to the PC sound card. TX keying can be done using VOX. Some connect
directly, others use a commercial or home-brew interface
(recommended). Use your favorite search engine to do a search on psk,
you's see many hits.

PSK31 is supported by the http://www.scs-ptc.com/ controllers.
A simple RS232 terminal is all you need to make it work.

Anybody have an estimate of the SNR required for accurate machine-decodi=
ng of machine-sent CW?

I realize this will depend on the hardware and method, so a rough idea i=
s sufficient.

dB in a 1-Hz noise bandwidth or dB in say a 500- or 3000-Hz BW are I sup=
pose the standard ways of expressing these.
The former can be deduced from the latter I believe.

You might want to read the paper that Ray W2RS has written on this subject. "The weak-signal capability of the human ear". You can find pdf versions via google. He did an interesting presentation on the subject on the AMSAT-UK colloquium some months ago.

I don't know, but it must be known, because years ago they sent Morse
at high speed by radio, receiving on ink recorders for transcroption
by Morse operators at typewriters.

> Also, USB adapters tend to be buggy devices. The Belkin F5U103 is the

This seems to be the case. I talked with Reinhold OH1NBF about this, and he made some tests last night with promising results.

The tests were run on two PCs, with Windows 2000 sp3 and XP sp1. The USB serial adapter was a Digi Edgeport/4, which has turned out to be the most reliable of the units he has tried. However, the drivers must be upgraded to at least version 2.15 for it to work well.

The following software combinations were tested on both platforms without any problems:

-NBF + TF2.7b in hostmode
-NBF + FlexNet32 + 6pack

It's very interesting why the operation of some USB serial adapters depends on the user mode software used. At least NBF uses just Win32 API asyncronous file routines and the DCB structure. It doesn't even rely on the rxchar-event, but uses a separate thread for deriving the read timing. This has turned out to be a very reliable solution especially when the cpu load is high.

I think that's one of those "it depends" questions. Folks have been playing with synchronous CW for years where DSP processing can decode CW that the ear can't even tell is there. Get away from the synchronous part, and it depends a lot on the technology and the speed.

If you are using some sort of tone detection in simple hardware, you need a MUCH better S/N than your ear does. But using a DSP, you certainly could get way down in the mud for low speeds. EMEers do it all the time and the recent LF tests used a similar scheme. For more practical speeds I imagine it would be a horse race between the DSP and a human.

..

---------
```

I guess it's some kind of archive of messages from some digipeater. I would like to recover the C64 file attached to the message, but have no info about the encoding and/or compression format used.
Can please anyone help me?

Thanks in advance,

Jesus, EA7HAC

Parece que el fichero adjunto se encuentra codificado con un algoritmo similar a uuencode o a base64. Adem�s, casi seguro que se encuentra comprimido. Pero no tengo idea de los algoritmos concretos utilizados, o de si existe alguna utilidad que permita extraerlos y reconstruir el fichero "doctor-dx.prg" original.

Alg�n colega ducho en estos temas podr�a echarme una mano?

Gracias de antemano,

Jesus, EA7HAC

I have gotten NBF to work with the Win95 version FlexNet, but no luck with
Flex32. Paxon works fine, but NBF tells me that Flexnet isn't there.

Hi All

Just started with LinPac and are having a few probs.

Q1. Am I to assume that it looks at UI broadcasts from FBB BBS's to get a list of downloadable messages? This doesnt seem to be mentioned in docs.

Q2. Looking through the sourcecode I note a reference to the /var/ax25/ulistd directory. My install didnt create this.. Is this where the message lists go?

I am using Tom Sailers userspace soundmodem code. It works well *most* of the time but I wonder at its ability to demodulate noisy signals. I have regular voice contact with a station (2M) at around S1 and below. Easy to hear him but packet data not so. Is there anything special that needs doing in the "tuning" setup? I run the scope signal at a peak of around 80% full range. Is sound card freq error something that needs allowance for?

Cheers Bob VK2YQA

Try adding the flex32-directory to the path. Now FlexNet even starts automatically as you start NBF.

If even that fails, copy flxapi32.dll to the NBF directory.

Maybe someone that loves this mode can tell me what I'm missing. Hard to tune in. Mode is wide as heck when most new modes are looking for narrow bandwidth. So exactly what is the benefit to this thing?

Thanks,

Duffy

Do you have a link?

I did a google search and found nothing. What is it,
a 15 tone modem?

Hi,

I wonder if anyone could tell me if TAPR are still alive and well and
in business.

I am based in the UK, therefore transatlantic phonecalls are out of
the question.

However I have sent them multiple emails because I am interested in ordering their TAC-2 kit ..... they have not yet had the decency to respond.

Could someone please confirm they are still operational.

Thanks

Ben

I understand they moved the office, and some things may have
fallen through the cracks. Send an email to one of the Directors.

I have a TAC-2 (Rev C) lying around, along with a Motorola
VP Oncore and Garmin antenna if you're interested.

http://www.tapr.org/tapr/html/Foncorevp.html

ftp://ftp.tapr.org/gps/motorola/oncore.eng.notes.pdf

I also have the floppy that came with it. I did have the TAC32
software, but the company quit sending me updates when I
dropped membership.

Let me know if you want it? This has been laying in a corner
for over a year now, so you'll have to test it for satisfaction.
If it doesn't work, I'll take it back. I can do PayPal.

Um, maybe I'm missing something obvious, but wouldn't
"asking them at their web site" involve email, which the
gent has already tried?

What's wrong with it? In what way did it not measure up?

This isn't a stringent application. The cheapest piece
of junk will do fine. Actually better, because you can
afford to blow it up if you plug the wrong cable in to
it. :-)

Whether they answer or not, the organization is pretty much dead, as far as membership is concerned. They blew their wad on the ill fated spread spectrum attempt, and as soon as they sold their rights to Hendricks a few years ago (to which he did nothing in return) is when I bailed. Both the Dandin and TAPR web sites are basically frozen in time from about two years ago.

I was excited about them taking up the digital vocoder, but they have dropped the ball severely on that as well. No one I know expects them to actually produce anything new anymore.

One of the benefits of membership is "Full information on
R&D projects." I never got the full story, and don't expect
anyone except Hendricks and TAPR Directors, who joined
him in raiding the organization, to ever tell the full story :-)

That depends on what they have available through their web site. I have never fully explored it nor have I been there recently, but they COULD have some form of "webmail" instead of conventional e-mail (internally implemented quite differently) - or a web-based BBS. It's also possible that if they are having a problem of some sort with e-mail, they might post that on their web site.

That depends on where he's been sending his emails...

Given that he's asking whether they are still operational, the web site
makes it pretty obvious they are. There's even an order page where he
can order the TAC-2 he's interested in.

Hi All,

Thank you very much for your replies to my message.

Steve, thank you very much for your kind offer, I am very interested in it.
What sort of pricing are we talking about ? (& approx shipping costs).
Email me offlist (rclocal@n0spam.yahoo.co.uk). (remove the n0spam bit)

Have a good weekend.

Ben

A lot of older ham radio software, especially DOS base software, only works with genuine Creative Labs SoundBlaster cards, especially the old SB-16. These cards are available quite cheaply still. This isn't a problem with more recent software.

There's a lot to be said for Laura's comment about picking something cheap. At computer trade shows and the like a lot of sound cards are available for less than $15 or so. For ham radio applications, these are no different than the $300 type. But you can be a lot more relaxed about your experimentation. Heck, for $10 you can even keep a spare board around under the assumption that you will toast one (although that's actually pretty hard to do!)

That's most unfortunate, as I had plans to order some more kits from them, and I had purchased a year's membership to help facilitate that (the cost of which I already made back in discounts on said kits).

I grant you, the reshuffle might explain the long delay I experienced in receiving my initial order, and why I've gotten a sum total of ONE newsletter in nearly a year.

Steve, I've not heard the whole story. Who the heck is this "Hendricks" person? Is TAPR itself going to implode, or something?

Thanks much.

Well, ordering kits is what keeps them in business, so I wouldn't
want to discourage that. If they ever produce a vocoder kit I will
rejoin and support them.

> I grant you, the reshuffle might explain the long delay I
> experienced in receiving my initial order, and why I've gotten a sum

Yes, I joined to get more information on the R&D and all I got
was the same as non-members, the PSR. I joined the Digital Voice

Sig, and so far, in a year, there hasn't been any traffic.

> Steve, I've not heard the whole story. Who the heck is this
> "Hendricks" person? Is TAPR itself going to implode, or something?

Let's hope they can liquidate and start over. At least clean up
the web server, and show some recent update dates at the bottom,
instead of 2001, etc. I don't have any insider information, I was
just a member like you. From what I understand they partnered
with Hendricks to somehow use their Spread Spectrum radio in
his desire to wireless network the big Indian Reservations. I
guess this would all of a sudden generate all kinds of investors,
and they could finally finish the radio. Alas, the stock market
crashed, and no one has any money. As far as I know, the
Google searches I find now all point to Proxim products, where
Proxim usually buys up any company that has a viable product.
You can see the radio still being listed at:

http://www.dandin.com/tdr900.html

I don't think they'll implode. They have a distinguished list of
directors, but who knows how many hours a week they meet
to discuss things. The PSR is pretty much their whole Public
Affairs right now, so whatever is in there, is all I know.

Ken
It's not that easy to find a live QSO partner. Suggest you call on 14073 or
14075 mark.
Majority of PACTOR tfc you monitor today is either BBS S&F or BBS to user.
To calibrate your dial, and make first real-life experiences, I recommend to
use some of
the 100+ BBSs, most of them stby 24hrs. Get an updated list from my
homepage:
http://home.tiscalinet.ch/hb9brj/ptc.html

```

Apologies for appearing on here for the first time with a 'help' posting - but I think that's what I need!

I'm trying to get HamComm 3.1 to talk with an HF PK-232MBX and it just don't work! Works fine with PK-232s on Tx/Rx FEC and works fine on ARQ Listen (when all the users are using PK-232s), but I just can't get the mailbox to open up for me. What am I doing wrong?

MTIA

Angus Graham, G3TXL

```

A friend is setting up a pk-900 for vhf/hf gateway use. For testing, he is connecting to his gateway on vhf and having it connect to my mbo on hf.

Trouble is, the gateway will only relay about half of my mbo's welcome msg onto vhf. The mbo (on hf) shows the whole msg transmitted and link turned over, and waiting for his reply, but he only sees half the msg and is waiting for more. And it cuts of in the middle of a line, so it's not an end-of-line thing.

Any tricks to making this work?

Thanks and 73, dave, wb0taq, colorado

TAPR is very much alive and well. I just received a couple of packages
in the mail Friday. The problem has been a computer that's been "eating"
orders, email, etc.

Automatic Link Establishment. It enables two (or more) HF transceivers
to maintain communications with the other stations throughout the HF
band by "testing" the select frequencies for optimum conditions. If
conditions are found to be better on another frequency, the stations
automatically QSY to the new frequency.

Hi,

Will u please help me in this problem,

I am using Kenwood TM D700A in packet mode connected with PC.

I want to receive and display GPS Data on my PC but I could not find any command to receive GPS data in Packet Mode.

Kindly tell me which command I should use to receive GPS data.

Thanks a lot in advance.

GPSTEXT <GPS sentence header>
Selects the GPS sentence that the D700 sends to the PC. (E.g. GPSTEXT $GPRMC)

LTMON n
'n' is the interval in seconds at which the D700 sends GPS data to the PC. (E.g. LTMON 10)

LTMHEAD ON/OFF
Selects whether the GPS data is prefixed with a pseudo frame header.

This message is posted for a friend. I will forward any info to him.

Thanks !!   73 de Jim K4PYT

jnipper@fdn.com

I'm trying to get started in Pactor. My main idea is to send and receive email from my boat. I understand the basics but I'm having a little trouble with the details. I understand I need an HF radio, Pactor modem, and computer. My questions are as follows.

Will any HF radio work? Does it absolutely have to have a Temperature controlled crystal?

I have seen many packet modems that say they work on multiple modes, Amtor, Pactor, etc. However they don't say what modes of Pactor they handle. I.E Pactor-II or Pactor-III how do I tell? What Pactor modems are popular?

Thanks
Robert

I know these are 2 antiquated pieces of equipment, but thought maybe someone could help me out.

I am trying to use the ACC2 (13 pin) connector on the Kenwood TS-440SAT as an interface to my PK-232.
The maximum output level out of the PK-232 is about 100mV; whereas the "Data In" pin of ACC2 requires somewhere
around 500mV "or less". Consequently, the mic gain has to turned way up in order to get sufficient ALC. Is there a mod for the PK-232 in increase its output level?

I've used the ASFK in/out phono jacks in the past, and didn't have this level problem...but I'd like to have everything interfaced via ACC2 to simplify things.

Thanks...Al ND2K

There is some activity here in Europe during our daytime on 14101 mHz
Calls to look for EA2AFR, GI4AHP, HB9BDM plus a couple of OH-stations.
Activity is sparse however.

73 Ted

Hi James / Robert -

The answers to all of your questions can be found at the following sites:

www.airmail2000.com
www.winlink.org

I have also added some comments and additional links below.

- Seth

> I'm trying to get started in Pactor. My main idea is to send and receive email from my boat. I understand the basics but I'm having a little trouble with the details. I understand I need an HF radio, Pactor modem, and computer. My questions are as follows.

As far as I know there are two services that support HF email, one commercial (Sailmail) and one supported by a group of amateur radio volunteers (Winlink). Sailmail charges a $200/year fee (see www.sailmail.com) and Winlink is free, but since Winlink operates on amateur radio frequencies you will need an appropriate class of amateur radio license. This will require passing written technical and morse code proficiency tests. Passing these these tests will definitely require some study but they are not terribly difficult. More info on amateur radio and the exams required at www.arrl.org. Sailmail, while not free and somewhat more limited in terms of connect time (and thus the amount of email bandwidth), does not require any more than a standard FCC ship station radio license (no tests required).

>
>
> Will any HF radio work? Does it absolutely have to have a Temperature
> controlled crystal?
>

Most high-quality HF radios will work satisfactorily (but some are more
preferable than than others - the web sites listed above have
recommendations). For data use the radio should have very good frequency
stability and if it does then a TXCO oscillator is not absolutely mandatory
(but probably a good idea).

>

> modems are popular?

The only modem that supports the Pactor II & III modes is made by SCS
(www.scs-ptc.com). The SCS modems are far and away the most popular for HF
email use, and in my opinion Pactor II capability is mandatory for
acceptable results for anything but the most minimal amount of email
traffic. Others may disagree, but you should note that both the Winlink and
Sailmail organizations very strongly recommend a Pactor II or III capable
modem - which pretty much limits you to SCS.

Thanks a lot Mr Roger my problem is solved in a very good manner,
I got the whole GPS string on my PC.

Lifting one leg of resistor R151 or R152 depending on which radio port you are
using will get you about 30 or 40 watts with a normal mike gain setting. This
assumes that you have the AFSK output pot on the PK-232 set to maximum. Drop
me an email if you are having trouble setting up the Din 13 pin connector. It

can be tricky.

73 and good luck,
C. Jespersen K2OG

Hi,

Anyone out there using APRS with the MFJ 1278 DSP....

I tried AGWPE but I am fed up with it.... won't work here not with the MFJ
not with the BAYCOM not with the soundcard...

Anyone any suggestion of another program who is working..

Tnx PA3DWC

I found it easiest to use an old mic transformer which gives isolation
as well as a 1:4 step up. Came out of a cheap dynamic mic. I did the
same for the RX audio but a 1:1 transformer..
If you are grounding the PTT you ought to ground the mic mute pin too
(pin 9) as this stops any possible mic pick-up on transmit. I use
parallel opto-isolators for this to give isolation.   The TS0440 is a
real pig for picking up RF on the audio.

I have looking a way to get into aprs and the new radio shack
digitraveler looks like an easy route. has anyone tried one and how
well does it work??

Depends on what comes out of its cable. If it's NMEA,
you're in business. If it isn't, you're not.

Since you're curious, why not try one and see?

Don't know about digitraveler. I have the Emap and it works
good with the THd7a. You know, though it is kind of unwieldy carrying
the GPS and the radio together with the cables and all. Does anyone
make a super-tiny GPS receiver that can plug into the THd7a and like
maybe stay stuck neatly in a little pack or something? That's what I
really need to make this truly handy.

I'm pretty sure it isn't NMEA. In Delorme's XMAP handheld edition, the GPS
options include NMEA, Earthmate, and RadioShack DigiTraveler.  There might
be a way to convert the data format to NMEA, similar to how people are able
to do that with an Earthmate.

I have the same, although I never worked out how to use it bidirectionally -
that is, show others' positions on the emap display as well as work as a
simple beacon.

But, if you only need to work as a beacon check out
http://www.garmin.com/products/gps35/

That's weird, because for me I do see other ham radio stations on my
Emap. I don't remember doing anything to turn it on. I have left it on
a really long time, days and days, and maybe that's what did it. The funny
thing is I'll be driving around, and I'll see ham stations from who knows
when sitting there on the map. I'm not sure when they go away.

Now that I think about it, maybe it'd just be better to make a less
unwieldy cable. I have the Garmin cable,
and an adaptor and the Kenwood cable. And, maybe what I need is to just
find a pigtail for the Garmin connector for a nice short connector, and
maybe a velcro strap to hold the two together. I'm surprised Kenwood
hasn't made a GPS/battery pack combo or something. That's what would
be perfect.

If I can only remember the outfit... Had cables for the THD7A and the
TMD700
made up...

http://www.bluehillsinnovations.com/

(Staying ahead of bitrot)

Had several cables made at a reasonable price:

```
     Garmin round to sub-miniature stereo jack (the Kenwood GPS jack)
     Garmin round to sub-miniature stereo jack w power plug (8 Volt)
     DE9 to connect sub-miniature stereo jack for GPS-to-PC cable
          (Garmin 168 has DE9 to connect to PC, use this cable
            to do a quick hack in the boat/car).
```

Proces & delivery were reasonable

regards
-Willy
KC0JFQ

Hi,
I would like to hear my vtech 900mhz cordless phone but I do not know if I am picking up the digital signal or hash. I have a pro 2005 with a optoscan board. Please let me know how you are able to hear a digital signal using a wideband scanner. I read that if you record the sound into a sound card and play it back as a pcm file it will work but I still get the same hiss sound.

```

All--I have a Sony ICF-2010 MW/FM/SW/AIR radio with both the AM and SSB filters replaced with the higher quality KIWA replacement filters. Radio sound and looks great. Asking $250.00US plus $10.00 Shipping. The Sony power adapter for the radio is also included as well as the owner's manual.

Please respond to wampus@nc.rr.com. Thanks

Chuck

I would love to find out how(unrepeatable) my FM
radio once tuned into a harmonic? of my Vtech 900mhz.
Seriously.  Copy was very perfect and there was a very
strong signal.

Bill

Duh! You use what you have. If you don't have a wideband scanner, you
don't use a wideband scanner. If you have a lab full of expensive
gear, then that's what you use.
Joop!

What kind of plug is on the bottom of the VC-h1? It's a wide,
thin metal shield. And inside it looks like there are two
sets of 8 pins, which clamp over the other side which is sort
of like the thin edge of a pc board, except it's black plastic and
is surrounded by another metal shield which matches nicely to
the plug on the other side. Kenwood want $30 for a pigtail,
which seems a bit much.

Don't laugh, I've done Taco Bell with cheap Zin before. Not bad at all if you order wisely.

Oak == great ratings from the critics. You'll laugh, but my pal at a fairly well-known winery recently laughed how he convinced the winemaker to use more oak and the ratings went into the 90s. It really happened, I kid you not. The joke is, my pal and myself both prefer the less-oaked and lower-rated vineyard designated wines from the same winery. Whatever sells, though...

Had some good 2002 wines last week, it's going to be a fine vintage for NorCal when they're finished.

I'm a sucker for mysteries, I guess.

OK, John, I wrote a little Java program this morning that implements the HDLC decoding process, and I'll send you the source code if it will help you figure out how to do AX.25 bit banging.

Anyway, here's what I decoded, columns are hex, hex >> 1, char, char >> 1:

```
ae 57 � W
```

```
86 43 ? C
64 32 d 2
b0 58 � X
a6 53 � S
8a 45 ? E
e0 70 � p

ae 57 � W
86 43 ? C
64 32 d 2
b0 58 � X
a6 53 � S
8a 45 ? E
61 30 a 0

3f 1f ?  - Control = 0x3f, SABM (P)

84 42 ? B
c5 62 � b - FCS
```

It's WC2XSE>WC2XSE SABM(P)

What do I win?

Anyone else want the program I wrote to decode this?
The AX.25 spec really is good about telling you everything
you need, except the HDLC bit stuffing stuff is not trivial
at first, try reading the 85C30 databook ;-)

Yes, I really have a life, but this was just a fun to
sling some code around.

;-)

Proposal for an Amateur Voice Switch by g1sle

So what is an amateur voice switch?

Basically you can think of it as a bit like a small telephone 'switch', like the sort of thing a small business would use.
The proposed switch has 8 'extensions' or in our case 8 radio channels.
A user with access to any one of these channels is able to dialup any of the other 7 using DTMF commands and have a 1 to one conversation.
He is also able to dial a 'conference bridge' if other users are also connected to the bridge he will be able to join in the conference, up to all 8 users may be on the bridge at any time.

So what hardware is involved in the 'switch'?

The switch itself is a small rack mountable unit containing up to 8 'radio interface cards'
Each radio interface has a unique number (effectively like an extension number) and for reasons that will become obvious the switch also has a unique number.
Each radio interface connects via a simple cable (audio in/out, PTT in and Busy out) to its associated radio.

So what frequencies do the radios use?

Any within the amateur bands.
No really I mean it, from top band AM to 248Ghz FM including repeaters, simplex

channels and channels linked to the various internet linking systems. As long as the radio provides RX audio and a channel busy signal and accepts microphone and PTT in, it will work on the switch. Infact, thinking about it the connection could be direct to an IRLP node.
My proposal is that the channels currently used for internet linking along with existing repeater channels would be ideal, this new technology is complementary to both and would benefit both the existing repeater network and internet linking.

From a users point of view what can I do and how do I do it?

Lets setup an example system.
Suppose we put up a 5 port switch with radios on port 1 GB3EE, port 2 GB3DY, port 3 145.2875, port 4 70.2625, and port 5 2310.025 we'll make our switch ID 1 for this example.
We'll put our switch in Bolsover for now

A user on EE may wish to link to DY in order to have a better chance of getting a reply to his CQ calls. To do this he would simply use his DTMF keypad to dial *12*. The switch interprets this as ' connect me to port 2 on switch 1.
The switch will then check that the required port is free, make the connection and alert on EE and DY, the user can then put out his CQ which will be heard on both DY and EE, any reply will also be heard on both repeaters. When he is done he dials *10* which is interpreted as 'connect me to nothing on switch 1' the connection is closed and both repeaters are then independent.

Lets look at another example
A 4 mtr mobile user is finding the band a little quiet, so he goes to 70.2625 and dials *11*
This connects him to GB3EE where he is more likely to find a QSO, but because of the excellent propagation to mobile users on 4mtrs he is also able to hold the contact many miles further than he could hope for on his 70cms set.

Another example
A user on DY would like to use internet linking, but DY has no IRLP connection, so he dials *13* which connects him to 145.2875, since there happens to be an IRLP node on .2875 local to the switch he can then dial on via IRLP to any of the several hundred IRLP nodes available.

Getting the idea? Think about this one....
A user on EE wants to talk to a friend in (say) Birmingham.
He dials *15* this connects him to the 13cms port on 2310.025Mhz, a similar switch located in (say) Lichfield also has a port on 2310.025 and a second port on GB3GB.we'll make this switch number 7 for our example.
So once our user hears the connect confirmed to port 5 on his switch he dials *72* this will be ignored by switch 1 his local switch but will be picked up by switch 7 as a request for port 2, he will then be connected from EE to GB via a 'pipe' on 2310.025.

We can go on adding ports and switches up to a maximum of 10 switches each with up to 8 connected channels, after that we would have to go to 2 digit switch numbers allowing up to 100 switches of 8 channels, a fairly powerful and flexible network by any standards.

So what about the conference bridge?

Simple, a user wishing to use the bridge just dials *19*, the requested 'port 9' being interpreted as a request to join the bridge, he is then connected and traffic can pass to/from any other users on the bridge - IRLP users may recognise this - you will know it as a 'reflector'

But people will forget to shut down unused links won't they?

Yes of course they will, its human nature, that's why I put timeouts in, if a channel remains permanently busy for 3 minutes it will cause an auto disconnect, also if a connected channel remains without activity for 10 mins it will be disconnected.

You mention some 'prompts' how exactly does the switch tell the users what's going on?

All user prompts are in morse, the system is based around 8bit microcontrollers running at just 12MHz. Each micro has available just 4 k of code space and 128 bytes of RAM.
This leads to a system which is cheap, stand alone and reliable, unfortunately however it doesn't have the power to run voice prompts.
When a user connects to a port the number of the connected port is sent in MCW at each end of the link, thus as a link is setup between port 1 and 2 port 1 will hear a '2' and port 2 will hear a '1'.
When a link is disconnected either by the user or by a timeout both ends will hear a 'diss'.
If a user attempts an illegal operation, connection to a non existant port, connection to his own port or whatever he will hear an 'err'
Attempts to connect to a port already in use will get a 'bzy'

But isn't this dreadfully spectrally inefficient?

If correctly engineered this could improve repeater coverage in a way that would be much more efficient than many others.
Consider this example.
Handportable coverage from the existing repeater network in many areas is very poor or non-existant, one solution is to put up more repeaters, each using 2 frequencies.
Since many of the areas of poor coverage are sparsely populated in terms of radio users this is poor use spectrum, 2 frequencies are being used often to provide coverage to only 1 user at any given time.
Suppose we site a switch in one of these areas , provide a simplex port and a port on the more busy local repeater. We have now provided coverage in the problem area using only 1 frequency rather than the 2

required for 'full' repeater coverage.

So why isn't this on air now?

I have over the last few months developed the system to a point where I have 3 prototype radio interface cards on a switch allowing calls between any 2 of the 3.
Since operation of such a switch is outside the terms of my licence I need an NOV to operate it just as an NOV is required to operate an internet link or a repeater.
The Radio Agency have indicated to me that they have no 'in principal' objection to the idea, they have now passed details to the RSGBs Repeater Management Committee who will hopefully see the enormous benefit that this new technology could provide to the repeater network and amateur radio in general and give the project their full support.
Once the RMC approves the project I can quickly obtain an NOV and move to on air tests, I expect that development and testing of the full 8 port switch may take up to 6 months from my NOV arriving, however service could begin to be provided on DY and EE almost immediately.

My current machine has a CPU clock that lies above the 13cm amateur radio band. I doubt the Cray-2 did.

However, it is a single-CPU machine, so on array operations it will of course lose.

But this is always an interesting topic. What was called a "supercomputer" a decade or two ago, will most likely have difficulty keeping up with todays machines.

With standard desktop-grade disks I now get 45 MB/s disk troughput. I'm sure that is impressive even by classical mainframe standards. And systems with multiple SCSI disks perform a lot better.

Wonder how long it will take before even this box will feel slow...

Rob

Ian Wade wrote:

> The raw data is encoded as NRZI (non-return-to-zero-inverted).

NRZI encoding is done as - if I'm sending a 0, invert the state of the output, if I'm send a 1, don't invert the state of the output. In other words, NRZI encoding takes absolute levels and encodes them as transitions; a transition means a 0 and no transition means a 1.

For example, NRZI encoding of '01111110' results in actual transmitted data of '00000001' or '11111110' depending on the initial state of the transmitted data.

Decoding is straightforward.

> During the decoding process to recover the original data, the decoder
> looks for a string of seven consecutive "1"s or "0"s. When this is
> found, it *ignores* the next bit that arrives. I have shown these
> ignored bits as "-" in the recovered data above.

Actually, the bit-stuffing is designed to avoid 01111110 patterns in the transmitted data from being misinterpreted as flags. So, the rule of bit-stuffing is - after every 5th '1' in a row, insert a 0.

So, user data 01111110 becomes 011111010 and thus not a flag. Sure, user data 11111111 becomes 111110111, but it's not really about clock recovery, it's about avoiding undesired flag sequences.

The unstuffing rule is - after 5 consecutive 1s, if you have a 0, drop it. Note that 0111110, the flag sequence, unstuffs to 01111110, and thus remains a flag.

This doesn't mean that the bit after 5 consecutive 1s is always ignored, it's only ignored if it's a 0. It's kept if it is a 1.

I decoded a perfectly good SABM from the bit stream, BTW.

Just to clarify, the TNC-2 code was written by an individual who graciously
made it available in object-code form to TAPR, and through TAPR to licensed

TNC-2 OEM manufacturers and end-users, for ham use. However, he also uses
this code base for derivative products sold into the commercial (non-ham)
market for real money. Because of this ongoing use, he's chosen not to
release the source code.

There's enough TNC-2 source code out there, that this is a non-issue.
If we could just shift into second gear, is the problem. What comes after
AX.25 in VHF and UHF? Are we to bit-shift callsigns forever :-)

Seems to take 6 months before my "Fast new machine, wow!" becomes
"Darn thing is getting awful slow." and 12 months before it becomes
"This junk computer just MUST be replaced soon."

et.al.,

I want to thank you all for the many suggestions in helping me get my new toy up and running - well, here is the situation.

All is working well now! There was several issues that resulted in my unsuccessful attempt in getting the TNC working at the beginning.

-Firstly, I didn't know what I was doing, but was sure my ignorance was the problem, not the TNC.
--Secondly, my laptop, a compaq, is a piece of ....
---Thirdly, I received the TNC after it was set up for use with a GPS unit and I didn't know how to reset the unit yet.
----Fourthly, I was able to communicate using my laptop only if the cable was improperly connected which occurred when I first started working with the unit. The weight of the 9-25 pin adapter pulled the cable at an angle resulting in a "good" connection. But when I went down stairs I used a new cable, screwed in, thus having a correct connection that won't work with my laptop. After speaking with several of you, I performed a hard reset resolving the GPS issue. I then realized that I had tried the unit on 3 different computers prior to the reset and only the laptop after the reset. I, after calming down, connected the TNC to my reliable DELL P90 a miracle occurred - IT WORKED PERFECTLY. I connected to myself, left a message, read it, and killed it.

I just wanted to thank all that had many suggestions as I tried them all including 3 different power supplies, 4 different computers, 3 different cables, testing the internal battery (3.04v), continuity between pins 1 & 7 (signal ground and chassis ground) as suggested by kantronics, and checking baud rate. This has been a wonderful learning experience as I now know the manual cover-to-cover, inside-and-out.

<snip>

Hate to break this to you, but the technology for this already exists in a slightly different form. Motorola's trunking systems have a feature called 'PrivateCall' or some such. You enter the code of someone else's radio in your fleet, hit the send, and it bleeps their radio alone for a private conversation. What you're describing sounds like a bizarre combo of PrivateCall and selective repeater linking.

In short, you're not (to my eyes) describing anything that cannot be done, or has not already been done, with current technology.

Keep the peace(es).

I don't think he claimed that.
(but the story was so long that I may have read over it)

At first I got the impression that he was going to describe a standard or
maybe a design that he wanted to publish, but in the end it seemed to be
about a project in his own shack.

Could be, could be... And there's certainly nothing wrong with that. I was merely trying to correct what I saw as an impression that this was a new idea.

If the fellow wants to implement it in his own area, hey, great! That's a big part of what hamateur radio is all about.

73 de KC7GR

Boeing had nothing to do with the opinions expressed above. They
merely provide the Usenet pipe.

I just want to start using Flexnet as an end user -- but via a 6PACK TNC2.

Well, I figured it would become clear once I got into it. Not true.

I bought an MFJ-1270C on eBay cheap and picked up a 6PACK EPROM from the local guru, who belongs to my club. I installed the EPROM as per the instructions Buck lifted from the MFJ manual for TheNet. With the TNC connected to nothing, when I power up the POWER, CON and STA/MAIL LED's come on; the CON LED goes off in a few seconds but the other two stay on. Is this OK?

Now that I have done a brain transplant on my MFJ1270C, what do I use for a manual?

As to the software, I went on line and downloaded the old (MAINPKG.ZIP) and the new (FlexNet32.ZIP) and unzipped. The old has two .DOC files in German. The new has no help, DOC or other info files.

Where can I find manuals or documentation in English on how my TNC2
now works and how to operate FlexNet software on my PC under Win98?

I have an IQ in three digits and used to be professional programmer,
so if it is do-able, I can do it.

I wrote a demodulator that takes complex basebanded samples as input
and produces symbols (bits).

I'm still fine-tuning my bit slicer so I'm reading those bits off of a
waveform display (output of my FM demod).

```

Now that's a cool little project.
The necessary FCS code can likely be adapted from
the HDLC fast FCS code in RFC 1662; it took me maybe 10
minutes to produce a Java class to do the FCS
calculation.

The frame you sent, by the way, had a valid checksum ;-)

Is there any way that actual msg traffic could be passed while
using "unproto" mode. I have tried numerous ways to do so but
the "unproto header" gets in the way of the traffic text.
I/E every line of msg text has the unproto header interleaved
within the text thus messing up a traffic msg. The "read" from
disk feature only works while in connected mode! The "view"
file from disk works, however it merely reads the disk file
to the incoming (bottom) portion of the screen in unproto mode.
Then using cursor can move to each text line and hit "enter"
and it does go out okay but again carries the "unproto" tag line
so that screws up and prevents normal msg handling via unproto.
                              Joe

Unproto is just for chat.  It isn't a good way to send traffic.
It's merely an unacknowledged broadcast.

Unproto packets are perhaps the most efficient way of distributing message traffic at our disposal. To see how this is done, read:

http://www.tapr.org/~wa0ptv/

You can get the software there, as well.

To see this concept taken a little futher than the author intended see:

http://pages.sbcglobal.net/kb5iwt/multi.htm

There may be other programs (hopefully) MixW only receives PACTOR. I've only used MixW for receive. It supports many different modes (both Xmit and receive)
DEMO available at http://www.mixw.net/

Last I heard, there is no sound card program that will run PACTOR. The problem, I've read, is that there are too many timing problems under Windows to make a synchronous mode like PACTOR work. (There is no way to guarantee that a section of code will run at the time it is needed.)

If you want PACTOR-I, multimode controllers sell on eBay regularly for under $100. If you want PACTOR-II or PACTOR-III, you'll need to get one of the PTC controllers.

The timing critical parts have to run in kernel mode, ie as device drivers.
Writing such drivers isn't something most amateur programmers want to
tackle. There is/was a commercial PACTOR program that ran under DOS,
though, by the author of RiTTY.

Many thanks to the several replies to the original question. I won't hold my
breath for a Windows-based PACTOR capability for PC+sound card.

This all begs the question about licencing the code. As I understand
it all pactor implementations have a unique ID. Even if the sound
card option would work how could the unique ID be applied (or even
licenced by SCS).

AFAIK there is nothing in the PACTOR  protocol spec that requires a
unique ID to identify the implementation over the air. SCS's proprietary
PACTOR II might be different, but we aren't talking about implementing
that on a PC sound card.

Hi,

Does anyone have an electronic (like PDF) version of the ISO 3309
spec? If so, would you pretty please email it to me?

I didn't have any luck finding it with Google -- I only found
references to it.

Thanks,
John

Try your luck a bit more, I see it on page 3 of the Google results.
It costs 50 swiss francs to order at ISO.

Is that true even if the kernel has a realtime scheduler eg Linux?

This has been discussed before. One problem with soundcards is that the i/o is done using DMA. You prepare a block of audio data to be sent in memory, and point the DMA to that block. The block will then be sent independently from the processor, and an interrupt will be issued at the end of the block. At that time another block must have been prepared and the DMA is pointed to that block. Similar handling is done for input.

This buffering always introduces a (not exactly predictable) delay. So, when you are processing input and you deduce that the transmitter has to be activated and a certain reply has to be sent, there always will be some delay before that actually gets sent. In fact there already has been a delay between the moment the audio came in and the moment the process notices it.

So no matter how fast your scheduler is, there will always be some problems and you will always need to pull some tricks. Like keeping the buffers small.

Synchronizing the request-to-transmit with the audio to be transmitted can be done by using a fast VOX and use the two channels of the audio card (one for a key signal and one for the modulation), but that is only part of the problem.

Rob

: digital modes, operate PACTOR using a computer with sound card?

: Rick N6CY

Rick,

There was one done by Tom Sailer, HB9JNX, that I believe used a DSP based soundcard and run in DOS. I played with it a few times, and even got it to work. But to be honest, as already stated, with the low cost of multimode TNCs on Ebay, I decided to go that way for everyday use.

Search for Tom Sailer, HB9JNX, or TERMPAS.

That's one of the problems with ISO ... normally you cannot get
the standards documents without paying for them :-)

You might take a look at RFC-1662 (HDLC-like frames over PPP).

I agree. Really, for all the talk of the horrors of using Z80 based
boxes for ham radio, the bottom line is they are cheap and just work.

Linux has a pre-emptive scheduler, but it isn't realtime, at least not without realtime extensions (available from NIST as part of the EMC project). The pre-emptive scheduler is also too coarse for some time critical tasks. So even under Linux, you need to write time critical sections as kernel tasks instead of user tasks. Fortunately, that's very well documented (and free) for Linux, unlike for Windows.

Gary

I have a Garmin III+ GPS in like new condition. The unit includes the
original box, manual , pc cable and all documentation. It has had little use
and is a perfect unit for APRS applications as it does NMEA both in and out.
Asking $175 shipped to your home in CONUS. If interested please email me
directly at mmalloy@wi.rr.com.

I am a little ill at ease requesting this info as I sure that this has been beaten to death. What would be a good card to get for digital mode utilization on HF? I am currently using a member of the VIA family that resides on the motherboard.

Thanks in advance and don't hit me!!

My own favorite, for things like digitizing old rock records
as well as for Ham Radio, is the AWE64. Very low noise
floor, few problems with ground loops. I think almost any
sound card will do quite well for Ham Radio use though.

I am using the sound "card" built into my motherboard and works as well as
the SoundBlaster for PSK31. I have put the SB card on the shelf. Now audio
purity and midi sound equivalence may not be as good but works for me.

Hi Peter,

I just did a web search for Sunair and came up with this for Sunair Electronics.
Hope it might be what you want.

http://www.sunairhf.com/

Hate to rain your parade Don, but the auction original policy page included the proper sold as-is statement. Your pretty much out of luck... caused by your own actions.

I've had nothing but great results with Quecan and the many items I've bought through/from them. You simply didn't ask enough or the right type of questions...

cheers
skipp

I see where it talks about TXDELAY as a timer in the AX.25 spec, but I
don't see where this bit sequence is associated with it.

Also, if this is the TX-Delay bit sequence, wouldn't the flag pattern
```

```
directly follow it?

Any help you might provide would be much appreciated.

Thanks,
John

Try decreasing/increasing the TX-delay, and than see what the
bitstream does...

Howdy, John!

Today I posted to the FlexNet list, and got back a message saying my post
was being held for moderation.

Has there been a problem there?

Charles, N5PVL

Which one of those relates to the topic under discussion:

One ham asks another
"Are there any places to eat near here?"
the other ham replies
"Yes, here are some I know about."

You still seem to have missed the NRZI part. The bit sequence you see in general discussions about HDLC is not transmitted on air, it is first converted from NRZ to NRZI.

Indeed there is no defined bitpattern for TXDELAY. The only thing that is defined is that there is at least one FLAG before the packet. The TXDELAY could consist entirely of FLAG sequences, or it could be something different. It does not matter.

Rob

Help - Recently purchased a used KPC-3 v8.2 from a ham on ebay. After much trial and error, I was able to communicate with the TNC via Hyperterm but not consistently (4800 baud, 8N1, Xon/Xoff). After turning the unit off and moving my laptop I can no longer communicate with the TNC. The power light fluctuates when hyperterm is running but no information come back on the screen. I have tried 110-9600 baud and hardware/Xon Xoff hand shaking to no avail. I was supplied a KPC-3 PLUS manual with the unit but the pc board is not identical so I don't know where the hard reset jumper is.

Does anyone know where I can get a copy of the manual and/or the hard reset? Any suggestions on communicating with the unit - I am assuming the unit is in good working order since it did work at one point. Have also tried Packterm (dos) and Packterm (windows) with no luck - just gives me a communications error on the TNC.

Robert

Sometimes the on-board battery can cause erratic behavior if it is below the voltage specification. You might try testing the battery, and if it is borderline (or worse) replace it and see if the TNC's behavior stabilizes.

Just one possibility... :)

I just grep'ed for nrzi and "non return" in the spec and there were no
matches. Can you point me to the section that discusses this. It
sounds like I'm missing something pretty fundamental. Thanks for
helping me figure it out.

There's enough TNC2 source out there, that you
don't need the source to any of the original ancient
crap.

No one is going to run a PBBS anymore, and all
that other overhead code to support it is pretty much
worthless today.

Why would you want it? There's plenty of sound card
modems available, that I cannot fathom someone wiring
up a Z-80 or clone.

QFSK is the way to go for low baud rates, and those
modems are on a chip, or interface the sound card.

I wish TAPR would have dropped the spread spectrum
project when they sold-out to Dandin, instead of waiting
another two years to junk it. Maybe could have invested
the CPU board in being connected to a nice QFSK modem.

Ah well...

kpc 3 + works great with my palm IIIc, and pocketaprs
and palm sources have a terminal program
mine worked ok, pocketaprs worked the best
type in pocketaprs in google to find the web site to down load.
hope this helped.

Q: Where are you seeing the 1's? Is this via an oscilloscope from a waveform
of the transmission, or are these byte values being read out of the serial chip?

I seem to remember something about under HDLC, adding an additional 1-bit when
there is a string of 6(?) 1's in a row.... You might be misreading it!

Actually, John, inserting those line breaks where you did doesn't help. Expanding the lines, you are seeing this (use fixed-width font to view this):

```
~~~~~~~~~~~~~~~~~~

~~~~~~~~~~~~~~~~~~
```

The raw data is encoded as NRZI (non-return-to-zero-inverted). In this encoding, after a sequence of seven consecutive data "1" bits or seven consecutive data "0" bits, a bit of *opposite* polarity is automatically inserted (this is known in the trade as "bit stuffing"). This prevents long strings of "1"s or "0"s being transmitted in one polarity -- with long strings of the same polarity, it becomes difficult to recover the clock required for decoding.

During the decoding process to recover the original data, the decoder looks for a string of seven consecutive "1"s or "0"s. When this is found, it *ignores* the next bit that arrives. I have shown these ignored bits as "-" in the recovered data above.

Thus in the first 3-line group above, the recovered data (after the stuffed bits have been stripped out) consists of a "0" followed by 39 "1"s, followed by "0011000".

In line groups 2 and 3, there are no sets of seven consecutive "1"s or "0"s, so the recovered data is the same as the raw data.

In the last 3-line group, the recovered data contains 21 consecutive "0"s at the end.

Note that flags are *not* bit stuffed. That is, they are transmitted just like you see in the AX.25 specification:

```
    0111111100111111100111111100 etc
```

This is necessary to distinguish between the flag pattern and data that
just happens to look like flags:

```
~~~~~~~~~~~~~~~~~~
Received data:   0111111100011111110001111111000
Bit stuffing:            X         X         X
Recovered data:  01111111-001111111-001111111-00  <<< "looks like" flags

~~~~~~~~~~~~~~~~~~
```

So when you look at your raw data as a whole, there is no flag anywhere.
Hence I suspect that this is part of a binary data transfer, and
impossible to decode until you know where the flags are.

Hope this helps!

I can't say I'm surprised to hear that TAPR is dropping the Spread-Spectrum project.

After all those years of hype, all those "seminars" and "conferences", all those magazine articles and so on...

Ever hear the story about "The Boy Who Cried Wolf" ? After a while, everybody knew better than to pay attention to him.

Seven bits? IIRC after five bits. Typo, I assume.=20
Seven same bits in a row is the flag.

I was using a modem cable that I had around the house and was able to communicate for a brief period. A new cable was purchased with little difference in performance. At the present time the TNC is communicating with the computer but only gibberish or the beginning of "ENTER YOUR $^*^$*#". Very puzzeling. It was also suggested to check the voltage on the internal battery - it is running at 3.04v as needed. Powering the unit with a 12vdc supply.

I am also having the same problem with my KPC-3 (not plus) - purchased on
ebay and was given a KPC-3+ manual with the unit - different jumpers! I
wish Kantronics would have the older manual online. Let me know if you find
the older manuals - that would be a big help.

"... the power light fluctuates ..."
I don't think that should happen (?).
Perhaps the power supply to the TNC is faulty,
or the power ground return is not properly connected,
or there is some other cabling problem.

Try a different PSU if you can. Your original comment - "The power light
fluctuates when hyperterm is running..." points to a fault in that area.

Robert, I have the same TNC and the manual for it. Here is what the
manual says to do for a hard reset:

1. Open the KPC-3 by removing the two case screws on the sides of the
unit and lifting the cover.

2. Locate the Hard Reset Jumper (J7). Jumpers are appropriately
labeled on the PC board.

3. Place the jumper on both pins

4. Apply power to the KPC-3

5. Observe on the computer display (your terminal must be set at 1200 baud):

```
     CHECKSUM OK
     RAM OK xxxK BYTES
     CLOCK NOT PRESENT
     REPLACE TEST JUMPER
```

6. Turn power off.

7. Return jumper J7 to the normal position (one pin only).

8. Reassemble the KPC-3 and return to operation.

I hope this helps you! After reseting it, when you turn it on, you will probably see some garbage, then it will say "Press (*) to set baud rate". When you see that, hit * and you should be working, as long as there's nothing wrong with the TNC itself.

Hi guys.

You may or not have come across the MixW software by UT2UZ. It is a multimode software which uses the soundcard, and has packet capability. I think you would be amazed at how well it works rather than use a TNC.

The software together with other soundcard software's etc can be found on my site.

http://www.g3vfp.org

Regards,

Dave G3VFP.

Have a look at the user manual for the 85C30 SCC chip,
you can search for 85C30 at http://www.amd.com/ and get
the manual. It describes NRZI as well as bit-stuffing;
the 8530-family of chips were once popular for packet
implementation.

[Repost of a note that failed to go out yesterday]

I'm a sucker for mysteries, I guess.

OK, John, I wrote a little Java program this morning
that implements the HDLC decoding process, and I'll
send you the source code if it will help you figure
out how to do AX.25 bit banging.

Anyway, here's what I decoded, columns are
hex, hex >> 1, char, char >> 1:

```
ae 57 � W
86 43 ? C
64 32 d 2
b0 58 � X
a6 53 � S
8a 45 ? E
e0 70 � p

ae 57 � W
86 43 ? C
64 32 d 2
b0 58 � X
a6 53 � S
8a 45 ? E
61 30 a 0

3f 1f ?  - Control = 0x3f, SABM (P)

84 42 ? B
c5 62 � b - FCS
```

It's WC2XSE>WC2XSE SABM(P)

What do I win?

Anyone else want the program I wrote to decode this?
The AX.25 spec really is good about telling you everything
you need, except the HDLC bit stuffing stuff is not trivial
at first, try reading the 85C30 databook ;-)

Yes, I really have a life, but this was just a fun to sling some code around.

;-)

C'mon guys, check the references before posting ;-)

NRZI has nothing to do with bit-stuffing. Nothing at all.

It's an encoding method which sends a 0 as an inversion in the current transmitted level, and a 1 as no inversion.

Bit-stuffing and flags are HDLCisms. Bit-stuffing is simply adding a 0 after 5 consecutive 1s. Unstuffing means removing a 0 when it immediately follows 5 consecutive 1s. That's all. Bit-stuffing has nothing to do with clock recovery; it's just to protect the flag sequence.

The 01111110 sequence is an HDLC flag, and bit-stuffing prevents user data from triggering the flag. It's true, you should never see more than 6 consecutive ones under any circumstances in an HDLC bit stream, but that has nothing to do with NRZI.

Some time (a long time) ago, a thread about something that sounded like packet in the soundtrack of a movie appeared on Usenet. Or was it on a mailing list?

Anyway, the challenge was to decode it and someone did it.

Rob

Frankly, if someone was really interested, it would make sense to start over. Yup, start over. Build an open-source toolkit, initially concentrate on supporting the low-level functionality and providing an implementation with APIs to manage the HDLC transceiver, manage a buffer pool, manage the host link. The initial release would provide host-mode (KISS, most likely) functionality.

But, I question how much interest there really is...

Yes, the Z-80 code will have very little value as a reference.
It's been reverse engineered several times, and nothing good
became of it.

> Yup, start over. Build an open-source toolkit, initially
> concentrate on supporting the low-level functionality and

> HDLC transceiver

I would hope that HDLC would not resurge. It's been an
interesting exercise, I enjoyed packet in the late 80's, but to
continue on is not within the spirit of developing something
more advanced for radio.

The FEC stuff from NASA, or the block coding techniques,
etc, would be much more useful to experiment with, at both
the hardware and software levels.

> But, I question how much interest there really is...

True. A good question.

An "open source" TNC2 firmware exists, but it is written in C and
it is primarily focussing on hostmode. The compilation environment
may be difficult to reproduce. Maybe it is away to approach things...

I thought about this myself -

I think WC2XSE is an experimental (non-amateur) callsign
and it's some kind of test transmission. It's a valid
packet, though I admit I did not model the checksum and
validate it.

Fair enough. I suppose what I really meant to say, the toolkit
would have to provide support for the serial controller in all
of the interesting modes. The overwhelming legacy requirement
is HDLC/AX.25, but that doesn't preclude other modes. That's the
reason for the open-source toolkit approach.

> The FEC stuff from NASA, or the block coding techniques,

Indeed, you're right.

>>But, I question how much interest there really is...
>
> True. A good question.

I know for one I'm not inclined at this point to
run off and take on this project.

Yes that was it. The remark at the end is very interesting:

P.S. A Cray-2 is about 50% faster than the fastest Pentium-Pro computer
available today.

That means my current machine is much, much faster than a Cray-2 :-)

(this will probably depend on the application)

Yes, there is that little issue about what the PPUs could
manage as data transfer rate in the Cray, compared to
what IDE or SCSI can manage :-)

WC2XSE is not a current Ham callsign (FCC database, today).
So it is probably an experimental license.

I totally agree with you.   But that's not the point I was making.
The posting I responded to was suggesting that a saound-card based
system was as good as a TNC based system. It plainly is not.   With
the latter you can leave the TNC (and radio) running, without an
additional computer and still enjoy the benefit(?) of a mailbox.
Additionally if your TNC has a K-node, you are providing a facility
which others in your area can possibly make use of.

With a sound-card based system, though you can still have a mailbox
etc. All of that stops when you turn your computer off.

Nick.

Many amateurs use a TNC to connect to others and to application systems, like a BBS or DX cluster. They do not really benefit from using a TNC instead of a soundcard (on a modern computer), as they need the computer for their keyboard/screen anyway, and they cannot do anything useful when the computer is turned off.

I leave my computer on all the time, and I use an SCC card for packet. But for a small standalone application a TNC could be useful.

What I find disappointing is that a TNC does not allow you to run your own small application, instead of or in addition to the ones the firmware designer has thought of. That would enable the use of a TNC for newly developed applications without the constant upgrading of firmware.

It would be nice to download a (somewhat clever) APRS application and then attach a GPS receiver instead of the terminal. Or a weather station.
Or write your own application for other telemetry or telecommand purposes, where the RS232 port of the TNC is connected to a given device with given protocol, and a small application is needed to talk to the device and use a sensible interface over the packet link.

Not very difficult, but astonsishingly enough: not available. I have discussed it here in the past, and maybe I'll create something. But it always has to be more primitive than it could have been, because I will have to start from things like openly available KISS firmware, not the usual TNC2 firmware which is not open.

Rob

For my part, I based my soundcard packet system in an old 486 PC system. The whole deal, monitor and all cost 45 bucks or so, and it already had a soundcard.

This system ran continuously, leaving my personal PC free for other things at all times. The 486 would run terminal software, BBS software, a cluster, whatever.

Hi Stephen,

There are any number of small & light HF radios available, would need more info on intended use to recommend any unit in particular (how much power will you need, how important is battery life, etc.). None of the consumer units will be suitable for extremely rugged field operation, but should last if you take reasonable care of them. If you application is critical and you can afford the additional weight I would suggest having a backup rig available as well.

Also, if your main mode will be Pactor (for email access I would guess?) then I definitely would not mess with a Kam or any Pactor I unit for a critical application. I would consider a Pactor II-capable TNC mandatory.

- Seth

In article <Dh7l9.57141$1C2.2638826@bgtnsc04-news.ops.worldnet.att.net>, s.monsey@att.net says...

> Anyone have information on Metricom Pole top radios?

Ricochet.com is alive again, and they're going to try resurrecting the network over the next couple of years.

I know that the radios themselves are frequency-agile, about 60 or so channels in the 800 MHz area, and that each of the poletop units relays to a central hub.

Plenty more technical info at the ricochet.com site.

Good hunting.

It's called a ROM emulator. You remove the ROM and plug in a harness
that goes to a board, that then plugs into the parallel port. I have one
around here somewhere :-) You move the development software into
the boards RAM, and then the board simulates being a ROM.

A minor distinction at best.

The point I was making, was that building a TNC from parts, is more expensive than building a PC from parts. There are PC's that will fit in the same size of a TNC-2 modem, that are much more powerful than a Z-80 chip. Not only that, you can leave it on all the time, and consume less energy than a TNC.

No, that is not what I mean.

What I intend to describe is a feature in a TNC to download a small
application image into the battery-backed RAM. This application can
call a couple of API functions to access the serial port and the
usual functionality of the TNC.

With a ROM emulator you would have to write a full firmware for the TNC
that drives the hardware.

Rob

So the TNC should contain a Java virtual machine or Basic interpreter?

Thanks!

I was able to install/setup AGWPE and I got it working with my RASCAL and WinAPRS.

You would think one of the manufacturers would have done that by now.
I suppose the downturn in packet activity has put them off.

>Not very difficult, but astonsishingly enough: not available. I have

You could do a home-brew version. If it's only for your own use, you
could just swap the firmware EPROM/ROM for a larger one - if needed
(?) the firmware ROMs I've looked at have a lot of leftover unused
space already in them.

Then, just put the original code (suitably modified) back in, together
with your own additional code.

Using a larger ROM might mean playing with the addressing and of
course you would have to fully disassemble the original firmware
before you could modify it and add your own.   It could turn into a
real dog to debug. :-(

Makes using a sound-card sound almost attractive. ;-)

Nick.

$45 for a 486!!!   You were robbed!   :-)

I used to run a DX4 with two tnc's 70cms and 2M for a smallish
net-node. Worked fine.

That is probably not realistic.  The application should be written
in Z-80 assembler.

Ah! Ignore last posting. I also misunderstood what you were wanting
to do.

Mea culpa.

Nick.

Z-80?? Maybe use the CP/M emulator in Linux :-)

Here's what you need:

http://www.ibutton.com/TINI/hardware/index.html

The DS-TINI-1 is a compact (31.8 mm x 102.9 mm) 72-pin SIMM board. It is an Ethernet-ready hardware implementation and supports all of the following features:

Hosts the TINI runtime environment in a validated hardware design
10 Base-T Ethernet for networking
Extensive I/O capabilities of the DS80C390 microcontroller exposed through JavaT APIs
Dual serial ports
Dual 1-Wire� net interfaces
Dual CAN (Controller Area Network) controllers
2-wire synchronous serial bus
General-purpose digital I/O
Easy system expansion using parallel bus interface
Real-time clock for time stamping
Flash ROM for storage and execution of runtime environment
512K/1 Mbyte nonvolitile SRAM provides fast, unlimited write operations and persistent data storage
Level translator provides RS232 voltages
Wide operating temperature range, -20�C to +70�C
Requires only a single +5V power supply

Does anyone on here remember the old DC128V5 and its "Standard Text"
commands.   I still have mine created about 10 years back, but forgot
how to actually send the ST's in unproto mode, or in cmd mode.
Tried the following but nothing seems to send them out.
SEND A1   (or any other such as A2 B C D whatever)
Send ST A1 (also dont send it)
SEND MH   or SEND MH L   works fine,   but thats not part of the
          Standard Texts in memory.
I have the DOCs but nowhere can I find the actual syntax for sending
the "ST's" in either CMD mode or Unproto mode.
                 Joe/(old cbm user)

Standard Texts can be READ individually and displayed on your transmit screen, either to be transmitted when the colon [:] is not there, or for your perusal if it is. This is done with the Commodore Flag Key <CBM> and a letter allocated to the Standard Text you wish to see. ie. <CBM> Z will display the "goodbye" Standard Text from the default parameters. These will be active regardless if GERMAN is "ON" or "OFF".

If your looking for some old Digicom news letters you can obtain them at my web site:
http://n6jpa.netfirms.com/ftp/

If you have any further Digicom News letters I would love to obtain them and archive them on the WWW.

We have a Rascal R-KW-13 PSK31 unit that we just received. We plug it
in and the radio every 5 seconds does a quick blip in
transmit.Needless to say we cant check out receive yet till we get the
problem solved .
 We have Windows XP . Is this a comm port problem or software XP
problem? If its a XP problem I guess I will be forced to move the 466
mhz machine with windows 98 into the hamshack .

Hi Rob,

I have a PacComm DFM TNC and it has a GPS feature as part of its firmware. You use the terminal to set it up in GPS mode, issue the GPS "on" command then unplug the terminal (RS232) and plug in your GPS. It then transmits your position data, and an optional beacon message (I use the message to let people know about the PMS facility), at whatever Beacon rate you have selected. That great thing about this TNC is that whilst it is running in GPS mode, people can still connect to its PMS and leave a message, all whilst you are mobile. Of course you cannot read the messages until to reconnect your terminal, the STA LED flashes to let you know you have a message. I usually leave a bulletin in the PMS when I am mobile, to let anyone who connects to know what I am doing.

I have no connection with PacComm but just think this particular TNC is a great product. I use it in conjunction with a PacComm PSK-1 for fullduplex satellite work, at least I used to until the 1200baud microsats died, may have ago at 9600baud ones sometime.

Of course now one can buy a TinyTrak for mobile GPS use, but it does not have the mobile PMS ability.

Regards

If you have a Uninterruptable Power Supply (UPS) attached to your PC, be
sure the UPS Service (software) is not conflicting on the same COM# port as
the Rascal.

 Tony
Thats solved my problem. We simply removed the software from the
machine for the battery backup which turns the computer down after a
set time should the lights go out.So it was a comm port conflict with
that Cyber Power backup system . We now we just have the battery
backup in manual mode where we turn off the computer without it being
hooked to a comm port .

 73's  Bill

Hey Anita - Kiss my ass!!
<bcpirr@britshit.org> wrote in message
news:3d977954$1$70251$edfadb0f@dspool01.news.tele.dk...

> Description: Anita Roddick (founder and CEO of The Body Shop) commentary for the London Independent regarding American civil liberties since 9/11/2001
>
> ---
>
> How has the world changed since Sept. 11? For one thing, Europeans no longer aspire to *be* Americans.
>
> Who would, given how that country moves steadily and inexorably toward dictatorship? The American people, in a scant 12 months, have had their once-enviable civil liberties outrageously eroded in the name of patriotism. The ideals of freedom and democracy which America pledges to export across the globe have been perverted so spectacularly at home that America's admirers hardly recognise her anymore.
>
> Where once Americans reveled in their uniquely American right and willingness to criticize their government, they are now told that those who dissent are no better than terrorists, or terrorists themselves. They have had their pride of country, their patriotism, hijacked by a self-interested and short-sighted government which steals freedoms from its own people and gives riches to corporations and "security" infrastructures such as the military, FBI, and CIA, all of which which have proven, in the past 12 months, to be either fatally incompetent and totally corrupt.
>
> Those Americans who would question their government are told to "watch what they say." The FBI has been given broad reign to spy on citizens with phone taps and email snoops. Long-held ideals of fair and speedy trials are

```
thrown out the window as suspected terrorists and sympathizers are
"disappeared" like the enemies of Pinochet 20 years ago in Chile.
>
> In exchange for their freedoms, Americans are not safer now than they were
a year ago; in fact, they are probably less so. Their government is a rogue
state, rejecting international consensus on every front and threatening
first-strike nuclear attacks and politically expedient invasions of
sovereign nations. America has more nuclear, biological, and chemical
weapons that any other country, and it is the only nation to have used such
a weapon against another. And still it stubbornly refuses any international
effort or treaty to regulate, minimise, or eliminate such weapons, even as
it uses Iraq's suspected possession of (or mere desire for) them as reason
for wholesale attack.
>
> America's us-against-the-world mentality has managed to wear away almost
all of the remarkable international sympathy it built up just after Sept.
11. Bush & Co. has slapped the international community in the face as the it
tried to embrace and console the United States. Now the enmity has left
America alone, more reviled and isolated internationally than before.
>
> The scars of Ground Zero will heal, the grief at the loss of so many
innocents will ease, but the damage the United States has inflicted on
itself will last far longer. To hell with George Bush; God save America.
> ---
>
> A version of this article appeared in the London Independent on Sept. 11,
2002

An interactive Ham Radio message forum has been setup on the web. Be sure to visit and sign up at www.HamTalk.com

This is a great resource (free) to all Ham Radio operators, and makes mingling with other Ham's on the 'net alot of fun. Lot of great folks, so be sure to take a look...

Hi,

Here is what I'm thinking:

I set up my basestation 2 meter radio along with my computer. It
listens on a particular frequency and any time someone sends an APRS
packet to me, I'll have the computer look up the 5 closest restaurants
to them and then read back the restaurant names and addresses. I have
all the code required to do this, I just need to write some glue
software to make it all work together. The text-to-speech routines I
use are very easy to understand.

Would this be allowed, or would this be commercial use?

If this is allowed, I could see adding a DTMF interface whereby a user
could put my service into different modes for restaurants, shopping
centers, etc.

What do you think?
John

It depends on where you are!

I think you need to read your BR68 and then understand it if you are in the UK, but if you are elsewere then I don't give a *****!

It depends. As long as you make no money from the service, and you make no money from any of the businesses (i.e. they don't pay any advertising fees) then it should be legal. No different from an out of towner getting on the local repeater and shouting "hey, where's a good place to eat?".

73's,

Robert / N4IXT

Hi,

I am trying to set up my IC-T8E with a rig to PC cable to enable me to run packet via a WSA-1 interface (the serial port connector type of interface) without success. Receive is OK but I cannot activate the PTT.

I don't have a manual for the Icom but I have been told that I need a resistor in line somewhere. Can anyone please help?

Also, the mic I use for the Icom (which isn't an Icom mic) is the double-pin moulded type. These are both mono. Should the plug connected to the interface lead also be mono pins?

Thanks

Mike

Was on the air with RTTY and PSK this weekend. First time, and found it really interesting.

I am using HamScope from the RigBlaster 5.1 CD. Most of the setup is intuitive. However, one part of the operation is still a puzzle. (It is probably completely obvious to others----but not to me.) In RTTY mode there are two spectrum displays in the bottom window. Why? Is the lower one (green) a second channel? Is it connected to the middle text window?

If so, how is the second channel (and middle text window, if these are associated) used? Can I turn it off?

Also, in RTTY mode HamScope automatically looks for signals if there is nothing at the currently selected frequency. It widens the shift as it looks. Can I stop this some way? (I would rather have it stay on the frequency I selected, with 170 Hz shift, and make only small automatic AFC shifts.)

Last question: should my receiver AGC be ON or OFF for RTTY and/of PSK?

Thanks,

Bill
W2WO

I basically agree with Robert's view. BUT, you will get plenty of advice from local hams who think otherwise. You will get a LOT of heat, I don't think it would be worth the hassle. But I would be astonished if Charlie came knocking at your door.

Difference is the out of towner asked. Transmitting unsolicited
information that has nothing to do with amateur radio sounds like
'broadcasting' to me (Why not play your favorite music?) and IIRC
broadcasting is illegal even if it's not done for profit. My 2 cents.

I would at least look at the K2/100 from Elecraft http://www.elecraft.com/

Apparently you would need to have the ssb option for afsk (no fsk supported).

It seems small and tough, and since you build it - and test each sub-assembly as you build - you might stand a better chance of keeping it working in the field.

And I think you would find pactor-I sufficient unless you were going to transfer huge amounts of data. The pricetag on pactor-II is way more than I can justify - and the other station(s) would have to be equipped with it too.

Hello all. I am trying to set up a KPC-9612 with a Tekk KS-960 for 9600 baud. I purchased the 9612 used and was unable to get a manual for it. I am wondering if someone could let me know what each of the jumpers inside the 9612 are for (J1 to J21) as well as the 3 pots (R22, R32, R33).

Thanks very much,

Mike Fenske

Don't forget you must have a control operator in control of the station at all times.

I hope the ARRL doesn't value your opinion, because it is wrong
in this case. It's not broadcasting, because someone has to trigger the
response i.e., two-way communication. Second, it is completely legal
if you are not doing it for profit. This is the famous ordering a pizza on
a phone patch, that the FCC doesn't have time for, and is not regulated.

Did you graduate in the bottom 10% of your class, or did you get a
correspondence degree? Sheesh...

Don, you bogus idiot, notice he said packet? Packet does not require a
control operator, and unattended mode is encouraged. The space shuttle
does this all the time, and we don't have to fly up there to take them to court
now do we?

Nailed? By who? and for what? Gimmee a fuckin'
break!
Bullshit! Get a reality check Phil! K1MAN is still on the
air running unattended transmitters all day, splattering up and
down the ham bands. K1MAN has been thumbing his nose

at the commission, daring them to do something, and so far the commission is hiding, pretending K1MAN doesn't exist. And you can bet plenty people know Riley has been given orders to leave K1MAN alone.

73,

Tom

Hey Steve (Troll) K5OKC ...

Read Part 97.7 at

http://frwebgate.access.gpo.gov/cgi-bin/get-cfr.cgi?TITLE=47&PART=97&SECTION

=7&YEAR=2001&TYPE=TEXT

Sec. 97.7 Control operation required.

When transmitting, each amateur station must have a control operator. The control operator must be a person:

(a) For whom an amateur operator/primary station license grant appears on the ULS consolidated licensee database, or

(b) Who is authorized for alien reciprocal operation by Sec. 97.107 of this part.

Packet doesn't get a break on this - and ISS does have a control operator - the rules say nothing about where the control operator has to be.

Read some of the FCC enforcement letters - they always nail people on lack of a control operator.

Now go back to CB where you came from - the Control Operator principle is something you should have learned in the first few minutes when you were studying for your HAM license.

6-Pack (EPROM image) is 4.3k in size.

I heard someone talk about putting both the original TNC2 firmware and 6-pack on the same chip, then accessing 6-pack image instead of the regular firmware by jumping a jumper in the TNC2. It was just a story I heard though. I haven't seen it for myself.

I do not go for the theory that Kantronics is too overwhelmed by the complexity of adding 6-Pack compatability to their equipment, or by the great amount of space it would take up.

Kantronics has its own proprietary networking setup (K-nodes) and has been concentrating heavily upon capturing a good share of the APRS market. I'm sure that they have their reasons for not including 6-Pack in thier firmware, but doubt it has anything to do with lack of capability or competence on Kantronic's part.

After all, FlexNet is new in the U.S., and at this point, only a few states (though highly populated ones) are currently covered by the new FlexNet network in the northeast.

http://www.northeastflexnet.org/

So at this point, Kantronics is losing some sales in the northeastern U.S. due to lack of 6-Pack compatability, but not enough to prompt them to include it in their firmware. Check back in a few years, and it might be a different story. You never know, Kantronics may even start to think about sales in Europe!

There's an article by Mike Marcus N3JMM about software defined radio in
October 2002 QST. He suggests that manufacturers of commercial radios
which include DSP should allow much more user-reprogrammability of the
radio. However he concludes that one of the reasons they don't do this
is the user support aspects. The same would apply to user-programmable
TNCs.

The TNC2 is reprogrammable but you can't get the source code to the
latest release. In effect you would have to start from scratch.

Stupid you are ASSuming.

I clealy said/quoted nothing about the control operator having to be at the
control point.

Go troll elsewhere Steve!

Why not put the entire section up there? It still says "Each amateur station must have at least one control point."

Sec. 97.109 Station control.

(a) Each amateur station must have at least one control point.

(b) When a station is being locally controlled, the control operator must be at the control point. Any station may be locally controlled.

(c) When a station is being remotely controlled, the control operator must be at the control point. Any station may be remotely controlled.

(d) When a station is being automatically controlled, the control operator need not be at the control point. Only stations specifically designated elsewhere in this part may be automatically controlled. Automatic control must cease upon notification by an EIC that the station is transmitting improperly or causing harmful interference to other stations. Automatic control must not be resumed without prior approval of the EIC.

(e) No station may be automatically controlled while transmitting third party communications, except a station transmitting a RTTY or data

emission. All messages that are retransmitted must originate at a
station that is being locally or remotely controlled.

Yes, that is a problem. If I estimate the complexity of the problem well,
it will be much more work to write a document describing the available
API functions and the environment in which the application will operate,
than to actually implement the download functionality.

> The TNC2 is reprogrammable but you can't get the source code to the
> latest release. In effect you would have to start from scratch.

Or from the available KISS-mode sources. But that will mean the API
will only be "send and receive HDLC frame" and any connected-mode
functionality (the AX.25 protocol) will have to be provided by the
application.

Rob,

If you're serious about this, you might look at the firmware for the
TNC-1, which IS freely available and should be fairly easy to modify for
use on TNC-2 hardware. Sounds like something I'd have loved to have a
few years back! (Before I got too old/lazy ;)

73,
Harvey

Thanks, but unfortunately the KPC-9612plus is different internally from the
KPC-9612. Jumper numbers are different and the drive levels are set digitally

```
instead of with pots.

Aw come on ... he couldn't even spell your identity correctly
(that missing space after the comma).

Dumber than most forgers.

Shuffle a copy off to abuse of course ...

When I don't want people to know who I am ...
... I use a different email client, on a different machine,
via a different ISP, and have a totally different identity.

... it is soooo much simpler that way :-)

Well it looks as though Quecan of Canada is going to try to shaft me on the Sunair GSB-900SC I purchased from them through Ebay.

I paid almost 500.00 for it plus 100.00 shipping. Upon arrival I found that there were problems in the power supply, It had a bad microphone, the power cord was missing, and that nine printed circuit boards were removed and missing.

I attempted to contact them and they avoided me for a couple of days. When they finally did I contact me I was told that it was sold AS-IS and I was stuck with it. I tried to get them to agree in either a partial or full refund or even to just send the boards. So far they have refused to try and correct the situation in any way.

While I can repair the problems in the power supply and even replace the mike cord, I do expect that the radio be complete.

Can I get any of my fellow green radio collectors to contact them and help get this resolved.

The contact person is Christiane BopldUc

That sounds about right. Alternatively, the vendor could release their
code with little documentation and say "use the source, Luke." Keen
developers could work out the API.

There are lots of recent TNC applications which don't involve a host
computer though (APRS). Still, it must be possible - there's a
relatively new APRS-specific digipeater called UIDIGI that is a new ROM
for the TNC2.

<snip>

I'm sorry you got hit. I will add my own warning as well. I got a Tektronix plug-in extender from them on Ebay. They communicated well, and shipped promptly, so I had no cause for complaint on that score.

However: The plastic guide on the back of the extender was broken, and there was no mention of this in the auction. The item was sold in 'as-is' condition, so it's pretty much a gray area as to whether I have any real recourse (I don't think I do).

I would urge all the group's readers to be very careful about dealing with QueCan. Period.

The preceding opinions are mine alone. Boeing had nothing to do with them other than providing the Usenet pipe.

I understand that the writer of the TNC2 firmware cannot release the source
due to contractual obligations.

Of course that is possible. But that alternative ROM has to support
everything from the hardware up. Possible, but it would be more attractive

to write only the application, not the AX.25 stuff.
(for a digipeater this would probably only be possible with the KISS based firmware anyway. but for a simple telecommanding/telemetry application it would be attractive to have the normal TNC firmware available)

I'm looking at the output of an FM demod of an AX.25 transmission on HF.

I see
01111111 (0 and 7 1's)
5 times

After the 5 "preambles" I see what looks to be the start of the data

The first 8 data bits look to be

01110101

From the AX.25 spec I thought the first 8 data bits would be the flag sequence:

01111110

Does anyone know why I might be confused? This is a very clean signal so I can eye-ball the bits.

Thanks!
John

That's quite a bit different than:

> Don't forget you must have a control operator in control of the station at
> all times.
>
> Don Woodward
> KD4APP

Packet radio must have a control operator (usually the callsign given in the from or via address), but the control operator does not have to be at the control point.

It is entirely possible to have a packet radio station on the air while you are asleep, and 100 miles away from the control point.

Thus there is no legal restriction to the proposed "Yellow Pages" idea.

Phil, perhaps you'd best explain. I am NOT a lawyer and in this case you ask one (and if you have to ask, it is likely a no-no). My understanding is that the amateur cannot make any money AND THE BUSINESS CANNOT MAKE ANY MONEY. To me, this would be 'advertising', not the same as asking 'where's a good place to eat'. It certainly isn't the same as hitting the patch and placing an order for pizza. I'd certainly not try it, but would appreciate it you could explain the correct reasoning behind this (my news server has been down for a couple of days or I'd have jumped in this sooner).

73 from Rochester, NY
Jim

It is also possible to have more than one control operator.

If you're asleep 100 miles from the control point, then you are
"not in control of the station at all times."

This ground has been covered in HUGE detail back in 1982-86.

The control operator is not required to click a button to allow
each packet to pass through the system he is controlling, but
only to be able to shut it down when notified there is a problem.

I know of at least one case where a control operator shut
down a system 2000 miles away, using an HF link, when
he discovered a system failure. I know of another case where
a control operator drove 50 miles to pull a breaker on a
failing system. Note that "system failure" might mean "was
passing not allowed traffic" when there were automated
means intended to detect and block such traffic.

No problem if you are sleeping ... someone will wake you :-)

You are right on target. The issue isn't the "control operator",
it's the nature of the content. Just as a "one shot" patch to The
Pizza Place is OK but conducting business with them on a regular
basis via ham radio isn't, asking "where's a good place to get
....." is OK but having a server respond automatically to every
such contact isn't OK. Section 97.113 of thr Rules may be good for
curing insomnia but it's still "the word". Amateur radio is not
supposed to be a substitute for any commercial service.

True, the FCC hasn't been spending as much time as necessary in
amateur regulation lately, but that's no guarantee that if this type
of stuff starts becoming commonplace the hapless amateur who does
this wom't get nailed.

Of course, the non-lawyers here who are sure that I am wrong must have
spent more than the 30 years that I did in FCC field enforcement and
must have more legal experience in interpreting the FCC Rules for
enforcement purposes (which is what I do for a living).

'Nuff of this stuff....

"nailed!" That's funny...

Did you "nail" them with "interpretation", or only just "hammer" them?

Phil:

The only thing applicable to the "Yellow Pages" idea in 97.113 that I see is "(5) Communications, on a regular basis, which could reasonably be furnished alternatively through other radio services.".

I asked a respected APRS person what he thought of the legality of the "Yellow Pages" idea, and he said "There will be many that say it is ok. there will be many that will think it is the end of HAM radio as we know it...".

You're right on target on the FCC - from what I've read of the enforcement letters sent out by the FCC on HAM related matters, it appears as though in the majority, the investigation that initiated the letters are based on a complaint by someone - another ham/neighbor,etc. and rarely if ever by the FCC. The reason I mentioned "Control Operator" is that lack of control/control operator is a common "catch-all" if the FCC can't find anything else to nail the violator on - kind of like the IRS' infamous "Income Tax Evasion". You are right - control operator is not what will make the "Yellow Pages" application prohibited but it's one issue the person who does implement this will have to deal with.

 Yup, and if I recall, the same out-of-touch arrogant
bureaucrat who started that mess, then went to a Little League
baseball game and created a federal case out of a radar gun
the coaches were using to time balls pitched by the kids. No
better example of how arrogant federal bureaucrats have long
forgotten their correct place as lowly servants of the people.
Nevertheless, if I recall, the same wacko bureaucrat died a few
years later of cancer. Strange, how some things come full

circle, eventually.

I agree with Phil but YMMV. Tell ya what: go ahead and do it then have your local ARRL Observer complain to the FCC and see what happens. Worst you'll get is a letter telling you to quit and asking to explain why you did it, followed by a fine or license action. Then you can set us all straight.

John,

There has been a lot of arguing over this thread, but I had a thought. Forget the FCC for a minute. I recently read that some companies are suing 'Gator'. It seems they advertise and pay for the advertising, but the Gator ads sometimes cover theirs - PLUS Gator's ad may be for a competitor. I've a question. Suppose - just suppose - some licensed amateur receives that packet with those restaurants - and happens to own another restaurant that isn't listed. Just perhaps your biggest problem might suddenly not be the FCC .... BTW, if you're an ARRL member, a lot of the folks in this newsgroup just might turn to page 9 of the October, 2002, issue of QST. That is one heck of a good editorial. I suggest you read it and consider what it is saying.

73 from Rochester, NY
Jim AA2QA

ups trashed my ft-one beyond repair... so i am parting
it out...

gone - if board, ram board, fm board
left - everything else, including knobs, meters, power
        supply, etc.

i also have the original owners manual and the yaesu
technical (service) manual...

no reasonable offer(s) refused!

Hi, I have set up HamBBS at yahoo groups as a central point where
we can exchange details of amateur radio telnet and nntp BBS's that
also have access on the internet.

If you know of any such sites, please post details on the yahoo site.

Thanks

True. I would fear a capitalist more than a socialist, but
the government is now hiring mostly non-professional
people to run the fascist police agencies, and with laws
that allow them to confiscate and sell your property before
trial, they are giving the capitalists a true run for their money.

I've never been a member of the in-bred mafia there in New
England, although I did write an article for them once, that
was rejected, and I sold it to another magazine. What are
they bitching about now?

Howdy, folks.

This message is about my ham radio resource for those who have WIRELESS access to WML pages. In otherwords, if you have a cellphone or pda that can read WML (like an Ericsson or Nokia, and so forth), or, you use Opera (the Webbrowser), then you can access the special format of the radio pages at http://wap.hfradio.org/ - if you browse that page with a normal webbrowser (say, Netscape or MSIE), you will be redirected to the normal HTML pages at http://hfradio.org

With that said:

I've added a large number of additional DX Cluster pages - spots by band, by special interest (IOTA, Mobile, QRP, and so on), announcements and wwv reports. These WML pages are NOT on my normal site (since they are from the DX Summit site). These pages are an interface for WIRELESS browsers to the DX Summit pages. If you are a wireless device user (cellphone, pda) that can browse WML pages, check out

http://wap.hfradio.org/

There are more resources than just the DX Cluster, by the way. I also provide live propagation data, forecasts, and related information.

I'd love to hear how the WML works on your cellphone or other WML device. I have tried to create pages that render well on all versions, and so forth.

Enjoy.

This rule exists to protect our bands. From being taken over
by commercial interests. I'd forget about the yellow pages
thing on a ham repeater.

The FCC would ask you to shut it down if they had a problem with
it. Only if you then didn't would the fines and stuff happen.

It's not like the FCC will pounce on you for using the wrong mode
in some subband by mistake once.

Hi all,

Try to visit my APRS screenshots at url:
http://f5tci.free.fr/aprs/index.html

It's only local APRS packet radio RX on 30m and 2m
here on my QTH JN36IE (bad 2m links today).
These Win95's screenshots are uploaded each minute
and your navigator will refresh the page regularly.

Pse, your infos/suggestions to f5tci@tiscali.fr

Enjoy on APRS and 73's.

Can anyone decode this AX.25 bit stream.

It is one station trying to initiate a connection to another station.
I inserted the first few line breaks just to expose the starting
pattern.

I thought that I would see the flag sequence 01111110. Any idea why I
don't? Is that not sent until after a connection is established?

01111111

```
01111111
01111111
01111111
01111111

I have been running Flex32 in my Win98 machine for some time, but have had to use a 6-Pack TNC because I never could get the SoundModem driver to work. Some Hams would report excellent results with the SoundModem driver, while others had trouble getting the PTT to work. I was one of those who was having trouble. On some machines it did fine, on others it didn't. So when I ran Flex32 on my Win98 machine, I had to use a TNC with the 6-Pack firmware.

The FlexNet group recently released a new version of Flex32, intended for all versions of Windows from Win95 on up. Out of curiosity, I downloaded it and tried it out.

I was pleasantly surprised to see that the SoundModem driver for the new version works perfectly with my Win98 computer.

If you have tried Flex32 and the SoundModem in the past and was dissatisfied, it might be worth your while to download the new version and give it a try. Be sure to get both the new version of Flex32, and the latest SoundModem driver.

http://www.afthd.tu-darmstadt.de/~flexnet/

If you are not into IP, a good terminal program designed to work with Flex32 is Paxon.

http://www.paxon.de/download.php

This gives you a really nice soundcard packet setup for Windows. I have heard that the new version of Flex32 works with Windows XP, but haven't verified that yet.

Hello!

My friend and me would like to connect our PCs through radio to share an
Internet connection. We live in the opposite sides of the same block of
flats (no wire and we can't see each other). Low bandwidth (~1-2kB/sec)

```
would be enough for us if it's cheap.

What commercial options do we have (we're not radio amateurs), what are
the cheapest radio solutions available?

Does anyone have a schematic for the level converter cable on Yaesu or Standard
radios?

It is used to program the radio's frequencies.

Thanks

Have you checked out the wireless routers ? With them you could have full
speed internet if they have the needed range.
You may be able to make a small beam for each device as the frequency is
very high.

802.11b wireless devices would be just what you need... they have a range of up to around 300 feet, more with external antennas added (you'd have to do this mod, or have someone do it for you). They provide very high speed and prices are getting pretty low, too.

Just make certain that you pick a "channel" above 2450 MHz. We have enough
JAMMING of our 2.4GHz band going on around here by the cordless phones.

Fortunately here the cordless phones are on 1880 MHz :-)
But they sometimes jam the DVB-S LNB-to-IRD signal.

Rob

Trying to make a powerpoint presentation of Echolink. Anyone done this?
Having a tough time getting the screens into PP.

I am a novice at this so please don't laguh. If someone has made a PP
presentation up please let me know want to present to the local club.

Thanks

The best way is to do an Alt-Print Screen which places the top window
in the clipboard. Then use Paint Shop Pro or a Paint program to paste and
then crop or emphasis the picture as needed. Save as a BMP and insert them
into the powerpoint pages. Ctrl-Printscreen captures the whole

screen (modal window and background windows).

Am looking for Radio Control gear for R/C cars and trucks that offer crystals for ham radio operators. I believe these are in the 50Mhz neighborhood.

I'm looking for something with the pistol-grip type transmitter with the wheel on the side.

Anybody have any recommendations? I plan to use the gear in a nitro off-road vehicle, or possibly an electric touring car.

Charles, N5PVL

Forgive me for asking, but why? The PTC is basically an HF modem, and the D7 has a TNC built-in for the modes it will handle. The use of these two together would be rather unusual.

That said, to get molded connectors, you'll almost certainly have to get one Kenwood cable and a 8pin DIN cable (MFJ or Mouser) and splice them.

Hi,

My PTC-IIe arrived today. I have it connected to a laptop and my Icom
756 Pro.

I've never done digital modes before (except for 1200 baud VHF packet
a long time ago).

Is there a way that I can automatically figure out what signals I'm
hearing? Is there some sort of "classification" capability that the
SCS modem can provide?

Where should I tune to hear Packet, RTTY, Pactor, and SSTV?

I tried to hear NAVTEK at 512kHz, but my antenna must be dead way down
there (It's a B&W ACS-1.8-30 inverted vee).

Thanks!
John

Hi John,

Check out: http://www.ac6v.com/opmodes.htm#D   ... just about everything
you could want to know.

As an intro you might want to start with:
http://home.teleport.com/~nb6z/about.htm ... provides an overview of each

mode with .wav files so you can hear what they sound like on the air.

Have fun!

- Seth   N6PL

I just purchased a RASCAL adapter to use with my Ft100d.. works great
on PSK/FSK, but I can't get it to work with WinAPRS.
Anyone know what TNC settings I should use in the WinAPRS setup ?

Anyone using RASCAL with APRS ?

Tom

The mailing list, located at:

http://groups.yahoo.com/group/hflink

is specifically about implantation of ALE within
the amateur radio service .. not much discussion
lately, but lots of file info ... Currently, I've been
prodding ARRL to see if they would support a
waiver of Part 97 that would accept an ALE
ID, consisting of the amateur radio callsign, to
fulfill the ID requirement ..

Trish..

Hey! Thanks for that info; I've needed that for another application, and yours was the first clarification on how to do that.

I can connect to nodes, bbs, packet clusters and what have you.
It works very well with a terminal unit program

I understand it's some sort of primitive digital communication (wireless and wireline) technique/protocol. Where is it documented? How does it work?

I have an FSK demodulator that's producing bits and I need a start/stop decoder to get the text out. Where can I learn how to do this?

Thanks!
John

Very cool. Thanks for the links.

Do you know of any automatic classification tools for the common HF modems?

Thanks,
John

When you install it, there's some HTML files in the directory,
and one of them lists various cities and frequencies. Mostly
up from 851 MHz.

Start/Stop means that timing for the bits that form a character is established from a Start pulse. The Stop pulse is just a rest period at Mark polarity to allow for small difference between send and recieving machine, so that a marginally fast sending machine can't overrun a receiving machine.

Another term is Asynchronous Telegraphy... just like on the COM port of your PC (be aware though lots of different codes, no of bits, length of stop bits, and speeds are used in different implementations).

Too easy!

Part of that mess at the url was fine and I don't know about the digital decoding but for the old mechanical machines the diddles are not needed or really wanted. They do have a big advantage for certain demodulators such as the ST-6 that has an ATC circuit in it.
Also the stop pulse for the mechanical printers is either 1.42 or 1.5 times the other pulses. It does not mater if it is longer so I guess that some computer programs just send out a dual lenght pulse as it is easier to program that way.

I beg to differ, the whole thing about diddles was orginally for the 'old mechanical machines aka teletypes'...There were many tests performed that clearly showed teletypes performed better when they were run at their designed 'machine speed' of 45.45 (or higher) baud. And of course it helped to keep the ATC/DTC circuits charged up in the 'TU's' etc...Slow speed hand typing without diddles was the worst type of reception and the most prone to errors creeping into the text....

Thanks a bunch. I wrote a start/stop (BAUDOT) decoder today and it's working really well. At least for test signals in the lab.

Thanks for your help!

John

I have a new Davis Vantage Pro weather station with the DataLogger serial output cable connected to COM2 on my PC. The TNC is connected to COM1. So far I haven't had any luck in getting WinAPRS to extract any data from the weather station. I suspect I have something set wrong within WinAPRS. Any help would be greatly appreciated.

73, Mont - K0YCN

Historically the first efficient printing telegraph systems used five bits per character, transmitted over one wire by time division multiplexing. In the days before electronics time-division multiplexing was high tech, hard to accomplish. It involved motors synchronized to tuning forks and schemes to correct for phase slippage and a lot of awful electromechanical stuff. The general problem was keeping receiving and sending shafts in exact synchronism over long time periods. Thus it was suitable for use only between large telegraph offices that had maintenance people on-site.

Howard Krum made the fundamental invention by realizing that it was not necessary to keep the shafts in synchronism over a long period of time, but only during the transmission of one character. This is accomplished by stopping the receiving shaft at the end of a character and having it wait for the beginning of the next character, hence the term START-STOP. This is somewhat less efficient than synchronous operation in the use of line time, since there must be extra time to start and stop the rotation. But it is so simple to implement that it can be used anywhere with only occasional maintenance.

In the mechanical system the line is maintained in the marking (current-on) condition when it is idle. The receiving shaft is held stationary by a clutch. To send a character the transmitter first sends a unit-length spacing (no current) pulse when engages the receiver clutch to allow the receive shaft to rotate. Following this start pulse come the five pulses of the character. Then the line returns to marking; and the receiving shaft completes it operation and disengages the clutch. There it remains until the next start pulse; so there is stop pulse of at least one unit duration and lasting arbitrarily long, until the next character is to be sent. The receiving and transmitting shaft drives have to be only approximately at the same speed since they are resynchronized at the beginning of each character.

This mode of operation is also called asynchronous, which isn't exactly correct, but does distinguish it from syncrhonous operation in which there is no starting and stopping between characters.

I could insert some quibbles about that diddle web page, but this has gotten to be long enough...

I still use DIGICOM V5 for the 128 for MARS work. I have never used the NODE features in it however. Its been so long since I installed the "ST" standard texts I forgot how to send them out. They are still in there and can be edited but what command is used to actually transmit them a line at a time. I tried.
:send a5 (In connected mode but nothing happens)
I tried
:send a5 (in unproto mode but still doesnt go out)

The docs are very good on editin the various lines but skimpy on how to actually send them out. Some of you UK guys might remember....
Joe (aka kilroy)

The PE stands for Packet Engine. AGW is SV2AGW callsign
of the author:

http://www.raag.org/sv2agw/

The PE provides a common interface for many different TNC's,
and also includes a soundcard interface. There are quite a few
applications that interface to the PE. Applications can also be
built by programmers by using standard calls to the PE routines.

If you don't mind leaving your computer running all of the time.

Of course with a TNC, you don't even need a computer.

A TNC is a computer.  But a very small one, and with software that does
little on application level.  When you want to do something useful,
you quickly will need a computer attached to it.  (some versions provide
a limited BBS but that's about it)

Hmm, I still have that project of downloading an application into a TNC,
still amazed that this does not exist yet.

Hello,

I would like to know or have ideas of a suitable lightweight (jungle
operation HF Rig) that can be used with PACTOR kit such as the KAM XL.

Operating 40M in South Americas as part of a Medical Mission so portability
is important so is robustness.

Hello,

I was playing with a APRS program I downloaded off the web and was wondering what I need to make it work? I have a PK232 TNC and a VHF radio hooked. What frequency do I tune too for listening? or transmit on? If you know anything about APRS please email me with the information.

Thanks so much...

Jeffrey - N9MXT

After bragging for over a year about the reliability of my soundcard packet setup at home, the old 486 finally went belly-up a few days back, with a dead power supply. Will do surgery on that later. Windows95 and Flex95 worked well together. The machine never crashed until the power supply forced it to.

In the meantime, I still need to be on packet so I set up Flex32 in my win98 machine, hooked up to an MFJ 1270 TNC with the 6-Pack EPROM installed. I had to make a connection cord to go from the TNC to my radio, an old VHF GE Pheonix. Doing the cord was the hard part... The software was easy.

Now I'm using Paxon for the home station terminal, instead of SuperPacket. Paxon is a lot more modern though, so it is a lot easier to figure out. Play around with a few menus, and it's all set up.

One thing I like a lot about Paxon is its use of wav files for sound events. Another great thing about Paxon is the nice file transfer options it has. Flex32 and Paxon do not seem to take up a lot of memory. I can leave them active for all while doing just about everything, except for a few video games.

Nice software!

Charles, N5PVL

Yes, I do know that.
What's your point?

That depends on local or regional bandplanning. Over here it is 144.800
MHz but that could be different for you.

When you scan the band for packet signals, chances are that you land on the
APRS frequency.   Most other packet is practically dead.

You should look for a freqency where you see mostly UI traffic sent over
many digipeaters with funny names, like this:

```
Sep 19 10:26:35.31 144 recv:
AX25: PA1GL->APGL v PI1APK* PI1FLD* TRACE6-5 UI len=28 pid=Text
0000  =5201.48N/00514.51E-PHG3230.

Sep 19 10:26:38.52 144 recv:
AX25: PE1KNL->W3ADO v APRSAT* RS0ISS WIDE WIDE TRACE7-7 UI len=63 pid=Text
0000  =5205.78N/00435.52EVpe1knl@amsat.org, Hazerswoude-Dorp {UIV32}.
```

I would imagine that he is trying to reconcile advice to use it, with advice not to use it. You say "go ahead", the documentation says "Its not meant for use with TNCs."

The problem is, both you and the documentation are right. (To a point)

I know of a ham who used the FlexNet KISS driver to sucessfully operate a TNC for years. He advocated the practice for quite a while - until he got his hands on a TNC with the 6-Pack EPROM. Since then, I have never heard him advocate the practice of using the KISS driver. Instead, now he goes on with great enthusiasm about how much better the 6-Pack setup performs.

I can't blame him, because I have seen the same difference.

Using the KISS driver will get you on the air, but I wouldn't call it a good long-term solution. At best, it will get you active while arrainging for a better setup.

Some areas still use other frequencies.
For example here you will find APRS on 144.39, 144.75,
144.61, 144.99 and probably others.
Tune around, ask people.

[snip]

Yes, that was my point. Having used Flexnet for several years in the
past, I'm well aware you can use it with a KISS TNC, but if you do that,
then it's a good idea to understand what you are losing. (It's explained
in other comments about KISS on the Flexnet site.)

Also, unless you initialise the KISS TNC from another app, you are very likely to finish up using inappropriate params.

I want to build my own Tiny-2 TNC. Mainly for 1200 bps but an option for 9600.

I am a member of TAPR. Unfortunately, they no longer sell a normal Tiny-2 Kit, although they do have the 9600 bps one.

Any reference where I can order a TNC kit would be appreciated.

Many of the chips are no longer available. Go take a look
at the AGWPE. The sound card will do all you need.

If you're interested in some programming ideas from this old 1999 piece of code, it is written in C and Visual Basic (You need Visual Studio to compile it as is).

This particular code decodes the data transmissions used by police and fire. Called the MDC-4800 protocol. This uses QFSK modulation (4-Level FSK) and audio should be extracted from the discriminator.

The docs are html and end up in the installed directory, with frequencies to try.

https://disco.aewa.net/mdt.html

Actually it says that it is not able to drive a TNC. That isn't true.

>
> The problem is, both you and the documentation are right. (To a point)

That is basically what I said in the second sentence that Roger did not
quote.
That sentence was "Yes and if you like what you see then you might like to
try what the others have suggested".
If you add that sentence to the one that Roger did quote you would get
something like this- Try it in KISS mode and if you like what it could do
then go out and buy a TNC that will take a 6pack eprom (like the others
said).

So I don't get misread again, I'll make my position clear.
If I wanted to try flexnet and all I had was a KAM TNC, then I think I would
try that in kiss mode and if I liked it, I would then spend dollars on a
TNC2 clone that can take a 6pack eprom.

It seems to me that when somebody runs FlexNet with a KISS TNC, you have to ask yourself what they actually are "trying out"?

If they are trying out the local FlexNet network, they could use the old KAM software that they are familiar with and get much the same effect. In fact, it may perform better because the original software would be optimised for either KISS or hostmode. This, instead of using a FlexNet KISS driver really intended to handle serial links.

If they are trying out FlexNet for home use, I can't see much benefit in having them learn to set up new software, only to have it possibly not perform as well as what they had originally. When you use the FlexNet KISS driver on a TNC, you are basically short-circuiting the advantages right out of FlexNet. It seems to me that if somebody is going to learn unfamiliar software, there should be some kind of tangible reward associated with the effort - like better performance!

The cheapest way I know to set up a full-featured FlexNet home station is to buy or get an old 486 and do the soundcard thing in either DOS or Win95. If you still have an old copy of Win95, that version of FlexNet can run more kinds of software than any other. It will run native DOS FlexNet software like the special version of BCT, and Clusse. It will also run DOS or Windows software that looks for WA8DED Host Mode, like FBB BBS (DOS or Win) or Superpacket. It will also run 32-bit FlexNet native apps like Paxon.

Sometimes, you can get an entire used 486 system with a soundcard already in it for less than the cost of a TNC.

Just a thot!

The software. No matter how good (or bad) the underlaying drivers are, the
software has to be more important. There is no point having the best
drivers in the world if the software is crap. So I reckon, check out the
software first and if you like it, then go out and buy the hardware you'll
need to improve performance.

The only reason that the KISS driver doesn't have the extras to make it work
like KISS does with other software is because the Flexnet people say 6pack
is better. So, being German, they are right and you are wrong and you will
not be allowed to make your own choice. I'm half German, so that would make
me half right and you half wrong :-) Just as well my other half lets me
laugh at myself.

I found the performance to be worse. Flexnet was very aggressive and tended
to stomp on other people quite often. And with 6pack or soundmodem, you get
zero choice in how aggressive it behaves. Your milage may very.
There can be other rewards, like the software. Flexnet32 provides one of the
few ways of doing what I did here- http://www.qsl.net/vk3bvp/ethrax25.htm
If you are bored enough to look at that page, take note that it was
originally written for ethrax25 which only used KISS.
That has all been replaced with Linux stuff. Much simpler and more powerfull
for what I'm doing.

I ran the DOS version of Flexnet (and flexdigi) on a 386 without any
problems using a soundcard. I found that the soundcard modem needed a lot
of horse power for Flexnet32. It almost worked OK on a K6-2 450 and was
hopeless on a p100.
I've since upgraded my CPU to an XP 1800+ and my OS to Linux, so I can't try
it (Flexnet) on that. Of course with Linux I have no need for anything like
Flexnet.

>
> Just a thot!

Always plenty to think about. Otherwise, why would we bother.

>
> Charles, N5PVL

I guess the bottom line is Ken is free to do whatever he likes.
And nothing you or I say can take that away from him.

ps: Charles, I think you may have asked about 32 bit mail software in one of
the NG's. Can't find that post.
I seem to remember using a 32 bit version of BCT or something like it.
Can't remember now, but there is something out there.

They are right, de channel access timing in a KISS TNC just sucks. You have seen the effects of that yourself, but you chose to blame the Flexnet software for being to agressive. Actually, when the stations on a busy channel all have good timing, it works well. When there are some that use KISS or have similarly bad timing, there will be problems.

> I've since upgraded my CPU to an XP 1800+ and my OS to Linux, so I can't try it (Flexnet) on that. Of course with Linux I have no need for anything like Flexnet.

In fact, the AX.25 stuff in Linux suck just as badly as a KISS TNC. That is because it is built on the assumption that the external world is interfaced via KISS, even when a better coupling with the system exists (e.g. in the SCC, soundcard or 6PACK driver)

The whole idea of having a transmit queue where the AX.25 layer puts packets to transmit, and a lower level (KISS TNC or driver) watches for a free channel then sends them, is bad. It should not work like that. It did not work like that in the original TNC firmware either.

The driver layer should report to the AX.25 layer that the channel is clear, then the AX.25 layer should decide if it wants to send something, ask to the driver to key the transmitter, the driver should then report when it had a chance to keyup and that the txdelay has passed, and ONLY THEN should the AX.25 layer be deciding the exact packet(s) that it is going to transmit. Depending on the received acks, state of the protocol engine, timers etc AT THAT MOMENT. Queueing up information for later transmitting leads to inefficient operation.

There have been plans to upgrade the Linux packet subsystem to work like this, and even patches for old kernels to partly implement it, but they have not become part of the mainstream kernel. The people making the changes (Germans...) have lost interest or have no time available.

When someone really wants to contribute to development of packet on Linux (or in general), they should take this up.

Sometimes hams ask about FlexNet and Linux... I always suggest getting an old DOS box to run FlexNet and handle the radios, with an ethernet or serial link to the Linux box.

Charles, N5PVL

As the original poster, I would like to thank everyone for their responses.

I am surprised that there is so much conflict and confusion. I found little net enlightenment in an area that should be fairly straightforward.

-Some endorse the sound card approach. I am set up for that (for PSK31) but have avoided it for packet because of alleged timing problems on TX. On a 400 MHz Celeron running Windows 98, can you effectively TX packet using a sound card?

-Some say an end user will do just fine with any KISS TNC; others say performance is greatly improved with a 6PACK TNC. I would expect someone to have some quantitative input on this. Do they?

I now have a KISS TNC (KAM--non modifiable for 6PACK) and will shortly have a used MFJ-1270C. The local Flexnet guru says he has the 6PACK EPROM I need for the 1270C. So I guess I will be finding out for myself. At least I don't have to burn my own EPROM; it did not seem like a capability I really wanted to develop.

Because each test you make requires mastery of different software and settings, there just isn't enough time (or money) to try it all.

I have for sale 1 full size "HY-Gain" beam 10 meters. fully assembled for your inspection. 13' Boom and longest element is 22' $75.00 I also have a steel tower totaling 25'. this is in 3 sections 1 10 foot st8 and 1 5foot st8 and 1 10 foot top section. I don't not have a rotator. $50.00. pickup only from Nashua,NewHampshire. I am selling these because they are to big for my new QTH. This beam has spent a large portion of its life in storage. 73's Jeff AA1GR

Hello all!
Anyone can help me to find the control software for the Signal One 1030?
I know exist this old DOS package:
"Bandview"

"Softpaq 4"
"1030 RTTY"

Thanks for any informations about !

Mac users,

I am looking for basic software for use with a KPC3. I have an old Mac
(Power Mac 7100) with OS 8.0. I have only found one, RDCP and can't unpack
it. I have the computer to learn a bit about Mac's. Thought I would put it
to work as a packet station.

While I support your efforts for an all-rf network, I have to say that based on the last two threads I've read here, you are responsible for half the BS in this newsgroup. The name-calling and "my way or no way" attitude and everyone who disagrees with you is a troll - all that costs you credibility.

If your way is better (and I believe it is), you don't have to remind everyone of their "failed paradigm" every two sentences. The facts will speak for themselves. And those who speak for the facts, ie you, should do just that, and not stoop to the personal attacks. If Mr Bush saw this newsgroup today, he would quickly retract everything he said about hams and channel more money into military and other preparedness.

I am not proud to be a ham (least of all a digital-mode ham) after reading this newsgroup today.

you might take a look at the old baypac BP2M, I have one and it works ok.

This newsgroup was long since taken over by the "Abandon radio, use
the internet and pretend you have a radio" Lids. If you want discussion
about using digital modes VIA RADIO, you have to go elsewhere.

That said, there are occasional discussion about how to do
things via radio. Just not very many in the last two months.

> I am not proud to be a ham (least of all a digital-mode ham) after reading this
> newsgroup today.

I think you are a bit confused. The folks actually doing work on digital
modes USING RADIO gather elsewhere. This newsgroup mostly
is for humor and flames.

Note that these comments only refer to the old style KISS.
The newer versions of KISS accomplish exactly the same
things that 6PACK does across the serial interface.
The newer version of KISS is only available on Kantronics TNCs.

> Also, unless you initialise the KISS TNC from another app, you are very
> likely to finish up using inappropriate params.

Seems like a failing of Flexnet. It is rather simple to pass the appropriate
parameters across the KISS interface.

Or perhaps lobby the Flexnet folks to make use of the capability
in Kantronics KISS to notify on frame sent

This is the key thing missing in the original KISS implementation,
and Kantronics has supplied it for a ... long ... time. Some of us

have made use of the capability long before 6PACK :-)

This situation needs to be addressed in the layer 1 (MAC layer) specification.

Some discussion a year ago about "What is KISS".
I think you talk about only the original KISS, not XKISS.
XKISS provides a signal to the upper level protocol (AX.25) when the
frame has been sent. See comments below, this is a very general problem.

> The whole idea of having a transmit queue where the AX.25 layer puts
> packets to transmit, and a lower level (KISS TNC or driver) watches for
> a free channel then sends them, is bad. It should not work like that.
> It did not work like that in the original TNC firmware either.

This is an interesting problem because of the layer violation involved.
I agree very strongly that we need to address this issue.
L2 needs to know things from L1 so it can make "good decisions".
We have no clear specification for L1.
The same is true at L3/L4. Layer 3 (e.g. NET/ROM or TCP)
need to adjust timings depending on what happens at the lower
layers. With radio links, the traditional methods do not seem to
work very well. A stronger coupling between the layers is needed.

> The driver layer should report to the AX.25 layer that the channel is clear, then the AX.25 layer should decide if it wants to send something, ask to the driver to key the transmitter, the driver should then report when it had a chance to keyup and that the txdelay has passed, and ONLY THEN should the AX.25 layer be deciding the exact packet(s) that it is going to transmit. Depending on the received acks, state of the protocol engine, timers etc AT THAT MOMENT.   Queueing up information for later transmitting leads to inefficient operation.

I think this is close, but maybe too restrictive?

AX.25 already knows which packet it should transmit next, once it know which packet was just now transmitted. XKISS provides this information to the AX.25 layer. AX.25 then gives the packet to the KISS layer. The TNC transmits this packet next, depending on the channel being free and any random delay having expired. Then the TNC notifies AX.25 that the packet has been transmitted.

Note that these ideas work the same whether L2 is AX.25, IP, or your favorite L2 protocol of the week :-)

> There have been plans to upgrade the Linux packet subsystem to work like this, and even patches for old kernels to partly implement it, but they have not become part of the mainstream kernel. The people making the changes (Germans...) have lost interest or have no time available.

> When someone really wants to contribute to development of packet on Linux (or in general), they should take this up.

How about a draft specification for MAC access timing issues?
You have good ideas (and I have implemented some of them).
You can communicate those ideas well (and I can't).

We have no specification for all the various channel access issues.
What we do have is, as you state, tangled up with L2 issues.

The reason there appears to be conflict and confusion is simple.
Running network protocols over RF is very very complex.
It is also not easy :-)

> -Some endorse the sound card approach. I am set up for that (for
> PSK31) but have avoided it for packet because of alleged timing
> problems on TX. On a 400 MHz Celeron running Windows 98, can you
> effectively TX packet using a sound card?

For what purpose?
How reliable?
What upper level protocol (tcp/ip?).
What applications do you want to run?
What bands will you use?

> -Some say an end user will do just fine with any KISS TNC; others say
> performance is greatly improved with a 6PACK TNC. I would expect

It depends on what you want to do.

>

You have to start by deciding what you want to do.
Play with packet? Anything will work.
Run a BBS? You need users and a network.
Packet Cluster? Anything will work.
APRS? You need something better than "anything".
Work DX using packet on 20M? Yet different requirements.
Establish a reliable long haul network link on 70 cm? Very different
requirements.

So everyone answers from their own viewpoint, and you
get confusing answers. Just like you asked "How do I work DX?"
I would answer that with "First put up a 170 foot tower, and mount
a quad array of boomers, feed 'em with the best hard line you can
afford, and run at least 1 KW. Then you can work DX on two meters."

But maybe you had in mind "I like 80 meters and live in the city."
So my answer made no sense.

The same has happened in this newsgroup.

As a packet newbie, I sit here looking at the 250-page Kam'98 manual
and the 250-page MFJ-1270C manual -- not to mention the software whose
manual is so big it comes on a CD -- and my reaction is that trial and
error is not the most efficient way of getting my feet wet. The used
MFJ costs under $50 (I have yet to see what the guru wants for the
EPROM). There is no way even at minimum wage I could exercise the KAM
for less than $50. I might as well go to the most effective hardware
and firmware from the outset. If you don't like it, you can sell it
for what you paid.

Everything you do in this hobby is more complex than it looks and
takes forever to tweak. After spending over 30 hours researching and
setting up my multiband HF dipole, I am still fighting high feed-line
losses and big common mode RFI in my house. I can do enough DX, so I
have put it on the back burner for now.

The only thing I ever did as a ham that was easier than expected was
PSK31. No wonder it has taken off.

I guess this means that my KAM'98 could work efficiently as a Flexnet
TNC if only the Flexnet software were programmed to drive it.
Correct? If Flexnet is so major, why wouldn't Kantronics provide
6PACK compatibility? Surely, they don't think they will change the
world?

Or is efficient Flexnet handling programmed into the KAM'98 and
Pacterm for Windows software? (I sent a query on this to Kantronics
10 days ago, but no response yet.)

(BTW, MFJ also seems totally clueless about Flexnet and the
desirability of changing the EPROM on its TNC-2 to 6PACK)

For my part, in this discussion, when I refer to KISS, I'm talking about
FlexNet's KISS driver, designed for linking up computers to each other, or a

computer to a FlexNet RMNC node.

From what I understand, the FlexNet KISS driver was written solely for that purpose, with no provision for use as a KISS TNC driver.

Because of that, I am dubious about it's performance, when compared to the KISS drivers in BPQ, for example, when used to drive a KISS TNC. The KISS driver in BPQ was designed for KISS TNC's, and the FlexNet KISS driver was not.

The FlexNet folks explain this all in the docs, but some people just don't want to follow the directions.

It's OK to make your own decision about following directions... But if you do ignore the docs and decide to "experiment", keep in mind the fact that you will be setting yourself up for unsatisfactory performance and when that happens, the poor performance will be your fault, not the developers of FlexNet.

My personal experience has been that when you use the 6-Pack driver/EPROM image combo, performance is significantly better than with the improper KISS setup.

The FlexNet KISS driver "works" with KISS TNC's, but it does not necessarily follow that it works well. Hank has pointed out implimentations of KISS that are advanced, having special features that make them do a better job with radio. The FlexNet KISS driver is not one of those. It wasn't designed to be used with radio at all.

Having had several years experience with BPQ, followed by several years experience with FlexNet, I can state with some authority that FlexNet's performance is amazing - IF you read the docs, and follow the recommendations found there. It's a different system, and to use it, you'll end up doing some different things... Just go along with the gag, and you'll have an opportunity to see why some hams are excited about FlexNet.

I heard about a ham who had an APRS setup with GPS reciever in his car. He also had a teenager. When the teenager would borrow the car, sometimes the ham would kind of forget to turn off the APRS equipment in the car.

Kantronics did XKISS long before Flexnet or 6PACK.
So the question is "Why does not Flexnet support XKISS?"
If you would like a 6PACK interface, you could contact

```
Kantronics and suggest they add the capability, or you could
convince someone to write the code for the Kantronics TNCs.

First you would have to convince them there is a market for such an EPROM :-)

They probably have to decide what they do and what they don't implement
within a limited budget of development time, memory space, etc.

Hank Oredson <horedson@att.net> wrote:

>> In fact, the AX.25 stuff in Linux suck just as badly as a KISS TNC. That is because it is built on the assumption that the external world is interfaced via KISS, even when a better coupling with the system exists (e.g. in the SCC, soundcard or 6PACK driver)

> Some discussion a year ago about "What is KISS". I think you talk about only the original KISS, not XKISS.

I talked about KISS and most people talk about KISS and mean the same protocol: one that only allows the transmission and reception of frames via buffer queues and provides no control over timing and buffering.

> XKISS provides a signal to the upper level protocol (AX.25) when the frame has been sent. See comments below, this is a very general problem.

That is only monitoring of timing, not really control. It is not sufficient if it only does what you describe.

> This is an interesting problem because of the layer violation involved.

Layer violations only exist to those that define layers and consider it bad to couple them. These are usually not considering the real world, only a theoretical situation where everything behaves independently.

> AX.25 already knows which packet it should transmit next, once it know which packet was just now transmitted. XKISS provides this information to the AX.25 layer. AX.25 then gives the packet to the KISS layer. The TNC transmits this packet next, depending on the channel being free and any random delay having expired. Then the TNC notifies AX.25 that the packet has been transmitted.

This is not sufficient. It is an improvement, but the following scenario still holds:

- ax.25 has unacked data queued, sends a packet
- packet goes to TNC and awaits transmission
- T1 timer is started. originally at this moment, in your case maybe after the transmission
- channel is busy, remote cannot yet reply
- T1 elapses and ax.25 queues another packet
- channel is still busy and it cannot be sent
- remote gets a chance to transmit the response and the data is acked
- local TNC now gets a chance to transmit and re-sends the already acked packet which it did not need to send anymore. adds to congestion
- remote sees a duplicate, and REJects it. adds to congestion

This can happen on a point-to-point connection, but the chances that it happens are even higher on a digipeated connection. And the effects are also worse in that case.

This is bad. And while it only occurs at a busy channel, it adds traffic to that already busy channel, something you don't want to do because it increases the chance of a collapse.

The only way to fight that in a KISS setup is the use of adaptive timers and backoff on each retry. However, that approach only works when EVERYONE uses it. When there are some stations with settable fixed T1 timeouts, they will win and the others will complain that these adaptive timers with backoff do reduce their throughput (to almost zero).

In a better coupled system, the situation can be more intelligently handled, waste can be avoided, and everyone is happier.
In my NET implementation of the SCC driver I attempted to address the issue not by "report back that the packet is sent" but by "report back that the channel is busy" (DCD active). The AX.25 layer uses this to stop the timers. The timers are only ticking when DCD is inactive.
So, on a busy channel the patience of the AX.25 layer automatically increases. This works quite well, although not perfectly. That is because a low persistence (at your end or the other end) still can mean that nothing is sent although a packet is queued and the channel is clear, so the timer still can tick and send an unnecessary duplicate.
But is it an awful lot better than a normal KISS approach.

I have sometimes considered to discuss an extension of KISS where the DCD on the modemside would be connected to the DCD lead at the RS232 side (via a suitable driver), so the 3-wire system would become 4-wire and the software in the PC would have more idea of the situation on the radio. Maybe also a connection from PTT to CTS, so you know when you are on the air yourself. But I feared that not many amateurs would want to make such a hardware mod in their TNC (assuming it could not be done in software, which it could be in some cases).

> Note that these ideas work the same whether L2 is AX.25, IP,
> or your favorite L2 protocol of the week :-)

Any tightly timed ARQ protocol needs this timing control, as we have also seen in the soundcard discussions.

>> When someone really wants to contribute to development of packet on Linux
>> (or in general), they should take this up.

> How about a draft specification for MAC access timing issues?
> You have good ideas (and I have implemented some of them).
> You can communicate those ideas well (and I can't).

> We have no specification for all the various channel access issues.
> What we do have is, as you state, tangled up with L2 issues.

What I was referring to w.r.t. the Linux situation is not a protocol definition or MAC timing issue, but an implementation issue in the current kernel. The current implementation cannot decently perform the protocol as it exists now. It also has problems with newer MAC level protocols like DAMA. Indeed there are many layer violations in such protocols, but it is a fact of life, not something that we can ignore and call KISS.

When you want to read about what the Germans have done on a new Linux AX.25 implementation, look here:

http://www.afthd.tu-darmstadt.de/~dg1kjd/linux-ax25/

Sure it would be good to have some discussion and/or spec of what are really important timing issues, but probably new volunteers that actually implement the changes will have to be found.

Rob

Thanks Ed!

I also have been looking on the other bands for PSK activity, and have found nothing outside 20. I will begin monitoring the other frequencies you listed (I had 7080 for 40 and 21080 on 15 for some reason). Would love to try some on 160 too (I have 1838.150 listed as the base freq there.)

73's,

Robert / N4IXT

Are you referring to the window issue or something else ?

With your approach the full AX.25 window size (7) could be utilised,
acking only every 7th frame, thus reducing the need for ack-frames and
increasing throughput.

No I am referring to the existance of a queue between the AX.25 protocol engine and the HDLC transmit engine. There should not be such a queue, if at all possible. The AX.25 layer should have a good knowledge of what has been actually transmitted and at what moment, and should be able to request a transmission without handing over the data to be transmitted at that moment. The actual data to be transmitted should only be presented at the moment the transmitter is actually ON (i.e. the medium access procedure has completed successfully) and the txdelay has expired.

The transmitted packet can then include completely up-to-date V(s) and V(r) information, and the transmission of unnecessary duplicates is avoided.

The KISS protocol does not allow this, and the AX.25 implementations that assume the KISS interface (starting from the AX.25 implementation in KA9Q NET) have been built assuming a transmit queue where they put data that they would like to have transmitted, and listen to a receive queue where only data packets arrive (no other information).
This means the AX.25 engine has little or no knowledge of what is happening on the channel, and makes mistakes like repeating packets that have not even been transmitted yet, repeating packets that have been transmitted but have had no chance to be acked (because someone else is transmitting a long series of packets), etc.

An AX.25 engine that has been written completely to the published specs will even end up in pathetic loops where all packets are sent twice, or FRMR conditions appear all the time. This clearly shows that the AX.25 protocol was not designed with a transmit queue in mind.
(AX.25 over KISS implementations usually deviate from the standard in one or more places to avoid this. e.g. by not responding to a REJ, by never sending FRMR, by replying UA only to SABM and reply DM to DISC)

Kantronics TNCs and perhaps others do provide DCD.
Some provide the choice of "busy with any signal"
(energy) or "busy because I see packet" (clock seen).
The DCD transition can be used to trigger events,
reset timers, etc.

As you point out this is different information than
"I just sent frame xxx". One needs both kinds of
information, and there are TNCs that provide both,
using XKISS plus DCD.

Whether you call it "layer interface" or "API" does not matter. The code needs a mechanism to report information between the different parts of the protocols. It would be good if this mechanism had a specification. Then one person could write channel access functions, another could write L2 protocol drivers, and the two codes could work together :-)

If the code is split between different hardware boxes (e.g. TNC, computer) then it is even more important to have a specification of how information flows over the connection between the boxes.

6PACK provides this, so does XKISS / DCD.
Each is available only on specific hardware.
And *that* is the problem ...

I won't even start to talk about the physical layer between the radio and the TNC. Standards? Nothing. Zero. Nada.

Hi  I'm looking for a manual for a SV-AV10
Panasonic digital camera.
any help would be appreciated

Kurt

I had a QSO on10.137 last night. A little rough copy (CT to FL). When we
switched to QPSK there was a huge improvement in copy-from 75% to 100%.

I'll be looking on 10.137 most evenings from 0100 to 0300 UTC.

73,
Ken K1XS

Lots of stuff there about abandoning the effort because he graduated school, and is now working for a living :-)

Some times "good enough" is good enough. AX.25 worked good enough for the 10 years (or so) it was popular. Since then, the only people to use it have been UI mode (APRS broadcast) users in a non-network environment.

Move on with your life now...

Um ... you meant 18 years not 10.
It is still the most used protocol.

Unless you consider RTTY of course :-)
That has a MUCH longer history.

No, I meant it was "good enough." Regardless of less
than 100% error-free protocol links. To me, the idea of
100% error-free network links is a waste of time. When you
get to "good enough" then stop and start using the blasted
thing, instead of going on and on about minutia.

```

But it was/is being presented as an organization, not as a forum... The fact
that it is a forum, if that is really what it is, needs to be made clear to
all.

That is what the infamous "we" of USPN needs to do.

Now that is simple!

hmmm... I had a 65 Rambler once...

It is clear, at least to me, that it is a personal web page, like half a trillion other out there. So it needs to be presented as such and not as the end-all authority on anything. Ever try FreeNet? There are many sites there that are part-and-parcel with this line.

Anyway...

People need to understand that USPN speaks for no one. It is a forum, nothing more, and, as Hank said, use it or don't. It has no relevance to anything apart from ego.

Then again, I know of at least two VHF/UHF Frequency Coordinating bodies that started just this way... Of course, everyone ignores them, too.

```

Areas outlined in blue mis-state your purpose (lie). You have shown =
here that

you are violently exclusive in working with others.

Steve,

In what way is the original author "violently exclusive in working =
with others" I saw no threats=20

of violence indicated in the original text. As far as statement of =
purpose, to me his

statement was meant to influence a cooperative atmosphere amongst =
American=20

Hams based upon an event that had widespread impact upon the American

people.=20

In fact, Steve (using your definition of "violently") you have shown =
you are "violently" opposed=20

to the person's views as stated in the original post. You accuse him =
of perpratrating=20

a lie with the statement, "Areas outlined in blue mis-state your =
purpose (lie)."=20

Enlighten me as to what the "lie" is, as the "lie" just does not jump =
out and make

me see the light!=20

Reading "between the lines" of your critical review it appears you =
take exception to

two issues:

1. George Bush and the government of the United States.

2. The right of the American Hams to establish an Emergency Packet =
Network=20

to insure communications when another "Jihad" event takes =
place.

I don't know what or who the USPN is but at least they trying to do =
something that=20

sounds reasonably constructive to me. Even if they do not use their =
spell-checker!

Kathy

=20

"Now is the time for all good men to come to aid of their country" - =
whoever said it

BTW, sorry if my lowly old BSEE does not make as literate or eloquent =
as you are

but I did run my spell checker! Besides us engineer are socially inept =
and illiterate

as everyone nose!

>=20
> Now is the time for amateur packet radio networkers [SIC] to share =
information,
> get to know each other and work together more closely than they ever =
have
> before. We will be addressing a challenge, answering to a mandate =
and having
> a good deal of fun while we are at it. It is this spirit within the =
hobby
> that USPN is here to facilitate. We dedicate our efforts to the many
> amateurs who participate in this fine aspect of amateur radio, and =
to the
> people of the United States of America.

That is why I used "is" instead of "is intended to be".
Perhaps it will become an organization at some point.
Charles made this clear, or at least it was clear to me.

I did spend the time to read the charter and peruse the

various threads on the site, and signed up and posted
a comment. (i.e. did my homework :-)

How else to get an organization started, other than
to attempt to gather folks together to discuss it?

Why say "outcast" when you mean "off topic"?

Exactly the same as folks who discuss using the internet
to bypass radio links here in this newsgroup. Lids.

Where did you find the charter, Hank? I have looked, read the forums, did a
suck of the web server, and sent Charles 4 E-Mails and still no charter.

Thanks!

```

Right here in this newsgroup.

Of course I didn't assume it would have "CHARTER"
pasted all over it in bright blue neon letters :-)

Remember: there is NOT an organization yet.
Part of building an organization is to create a charter.
Charles has posted his particular ideas for a charter
several times. Others may agree with them or not.

Perhaps you might discuss this in the forum itself,
which is where the issues will be hashed out ... if
indeed the whole concept gets off the ground.

Of course you could suggest a different proposal,
create a discussion group, and contribute your own
attempt to move things forward. I'd look at that too.

The interesting point about this newsgroup is that
what is posted here DOES cause things to happen.
Generally the folks who actually DO something will
not post here, but will go ahead and DO that something.

That's why I find it worth my time to contribute :-)

Okie Dokie

> In what way is the original author "violently exclusive in working with others"

Everything wrong with Packet Radio is the fault of a non-profit group that
produced a version of the Packet TNC. A group that not only designed
things, but developed and sold them.

> I saw no threats of violence indicated in the original text.

"Vehemence of feeling or expression; fervor."--American Heritage Dictionary

> As far as statement of purpose, to me his statement was meant to influence
> a cooperative atmosphere amongst American Hams based upon an event
> that had widespread impact upon the American people.

I can't deny it. The statement is meant to capitalize on the tragedy, much
like the Satanic pin-heads who print T-shirts with "Let's Roll" on them.
But it is not true. You merely have to read his publishing of a private email
and response to the Chicago Amateurs who wanted to become associated
with his mission statement.

> In fact, Steve (using your definition of "violently") you have shown you
> are "violently" opposed to the person's views as stated in the original post.

Read the response to CAPRA. [Lie 2]

> We will be addressing a challenge, answering to a mandate and having
> a good deal of fun while we are at it. It is this spirit within the hobby
> that USPN is here to facilitate.

Read the public response to the private email from CAPRA. [Lie 3]
Reading it was not "fun" and was not in the "spirit" of Amateur Radio.
The only thing being "facilitate" is hate of fellow experimenters.

> Reading "between the lines" of your critical review it appears you take

I take exception to anyone (pin-heads, or talking-heads) using a tragedy
to advance their cause. There, you no longer have to read between the lines.

> I don't know what or who the USPN is but at least they trying to do
> something that sounds reasonably constructive to me.

Think of it this way. When a faction of Americans shut down the forest
industry, they did so with fantastic rhetoric. Today we have nothing but
burning embers where nature corrected the mismanagement. That was a
tragedy, and no one will listen to that faction again.

> Even if they do not use their spell-checker!

Write back when all you have are embers (loss of spectrum).

> Kathy
>

I don't consider myself eloquent (and you will find no one who does), and
your achieving a degree in a very tough field is admirable.

Hi everybody.

I've recently developed a 9MHz digital SSB exciter. Unlike others modulator it is not based on a DSP microcontroller, but fits into a 30,000 gate XC2S30 FPGA.

Those interested in the subject please check the following url:

http://www.microtelecom.it/ssbdex

Rather than get into a protracted wordsmith battle over who is right or wrong in the world of Packet Radio,
I am closing this thread on my part with these thoughts.

I don't know about forrest or any other stuff mention but, havinge been to Kuwait, Turkey and other
destinations to the East as part of my job. The people are not the glowing Saints of Islam they portray
themselves to be. They use trickery and lies to obtain their goals, especially those with the money. They
mistreat women far worse then CNN or any media enlightened individual can ever imagine. I know
because another NCO and I were shot at as we crossed a golf course in Turkey because they don't
like American woman in particular!

I take exception to your referral to the President Bush as a "pin head". Mr. Gore would not have been
able to handle the situation any better. After spending 5 years in the DC area, I learned his kind of
weasel thrives on the misfortunes of others by pretending to be their champion for a price, giving them
federal handouts and making them dependant upon the Federal Trough for their food.

I apologize to the rest of the Hams out there for going out on soap box.

Kathy

BTW, I replied intact, the message must have been posted with items missing and our newsgroup only had
this one message.

I spent 8 years going back and forth to Riyadh, and flew missions there
during the Iran-Iraq war, and the Iraq war before I retired.  Suffice to
say, Arabia is nothing more than a culture of what we call merchants.
They will sell you whatever they have, whether it has value or not.  That
is their culture.  They have no national parks.  There is no Disneyland, and
there is no excuse for their existance, except to be merchants.

> I take exception to your referral to the President Bush as a "pin head".

No.  That's not even close to what I said.  I referred to those who would
use the tragedy of 9/11 in their mission statement as pin-heads.

Would you like more discussion of Packet Radio, and less BS? Having trouble getting anything pertinent to the hobby discussed here, due to the "noise level"?

Try the USPN Forum at: http://www.uspacket.net

At USPN, the discussion of packet radio does not get lost in the noise level.

A member of my club is a Flexnet enthusiast. I am interested and want to try it. I have a KAM'98, as well as a Rascal hooked up to a 400MHz Celeron machine running Windows 98. I am running Pacterm for Windows. I have a 2M transceiver.

I thought I could try it out using the KAM'98 but one of the Flexnet links said that none of the KAM TNC's could handle 6Pack.

The KAM and Pacterm user guides aren't much help. Can I do Flexnet with what I have? What more do I need?

Simplest way is to buy a junker TNC2, burn a 6PACK EPROM for it.

Thank you. I looked at the manual for the MFJ-1702C TNC-2, but it was
no help. Where do I get the EPROM I need?

Our local ARES unit is studying packet for serving agencies like the
Red Cross, who want not only voice but data capability. Sounds like a
good idea.

But... beyond the ARES application, what good is packet to me on a
day-in, day-out basis as a ham ? I'm not a DXer, so the whole
DXcluster thing doesn't matter to me. APRS - I'm not sure I want the
whole world to know where I am.

Mobile wireless text messaging really appeals to me, though. I used to
have a Blackberry email pager, and I loved it. I would be great to
mimic the same functionality on the ham bands; to be able to
interactively chat with someone. But I hear people saying that there
isn't a whole lot of messaging going on anymore, that it's all APRS

and not many live humans out there.

What's the current story, and which way is the trend-line heading ?

73,
Pete KF5ND - Houston

Actually, APRS is a heck of a lot more than just position reporting. It also includes, for example, weather telemetry, and text messaging. ;-)

I run a local igate, and it's very cool to be able to have text conversations with someone in CA, from New York, with only my THD7 out in the field, in real time. Not to mention sending email, etc.

General packet functionality was dying already when I got licensed in 1993, and, at least around where I live, is now pretty much all but dead. The only BBS's I've seen that are still running seem to have been more or less just sitting in someone's basement, and they forgot to turn the switch off.

And don't knock position reporting - my family finds it very amusing that I have a little Perl script running on my Linux box at home that announces, "Daddy is almost home!" through a voice synthesizer when my car gets to within a mile of the house. ;-)

- Rich

The more I read the more confused I get. Now I see that "end users"
can run any TNC, but that you need the 6PACK EPROM in a TNC (or is it
two TNC's) used in a "router."

> good idea.

Let the Red Cross tell you what they require, and then find
a solution.

a) Who do they want to communicate with

1) local
2) dx

b) What quantity of data

1) Number of MS-Word pages per minute
2) Number of bytes per minute

Start with the requirements. What they want may be accomplished
with pre-arranged forms and low data rates, or may require very
high bandwidth, which would not generally be available by Amateur Radio.

Ask the person who runs Flexnet.
They should be able to point you to web sites with the appropriate information.
You can also type "flexnet ham radio" or some such into Google ...
If you don't have the facility to burn your own eprom, you will
need to find someone who can do it for you, or else purchase one.
No, I have no idea where you would get one.

Sounds about right! The flexnet advocates seem to have trouble
explaining how you do it, and why you might want to :-)
Perhaps you need to talk to the local fella some more.

The Northeast FlexNet Group's page has the best introductory stuff on
FlexNet I've seen.

http://www.northeastflexnet.org/

On this page, I have put together a few articles I have written about
setting up FlexNet, including examples, and links to all the relevant web
sites.

http://pages.sbcglobal.net/kb5iwt/flexdir.htm

I run the FlexNet support Forum at USPN. The URL is below. There is also a
FlexNet mailing list at QSL.NET

Just wondering if there are any modes out there that are true ARQ modes
for digital communications using a sound card? (Besides amtor, pactor
which I am not even sure are available using a sound card) - it seems
all of the digital modes I have used (psk, mt63, mfsk etc) all use only
forward error correction...

What they mean is that since FlexNet is AX25, anybody with a regular TNC can connect to and use a FlexNet node/network. You don't have to run FlexNet in order to use the network.

If you DO run FlexNet when connecting to and using a FlexNet digi, you will get much better performance than if you don't. That's why it's worthwhile to obtain a 6-pack EPROM and put it in a TNC2 clone like the MFJ 1270, rather than using the Kantronics gear with your old software. Running the old-style stuff gives you old-style performance.

If there is FlexNet network in your area, one of the node operators can probably fix you up with a 6-Pack EPROM. They do not have to be edited for individual stations or TNC's, so it is possible to have a few spares on hand that anybody can use. Worth a try, anyway!

Most of the amateur packet modes use synchronous data, which is a bear to do

in software, especially in a highly non-deterministic environment like
Windoze. Modes like PSK are asynchronous, which is quite a bit easier to
handle. Now that computers are getting faster and sound cards getting
better, some software is starting to appear.

This is utter nonsense. When building a DSP modem that runs on the host
system and uses a soundcard, there is no difference at all between
synchronous and asynchronous data. You will have to do it in software in
any case.

It was true for devices like the baycom modem, where the hardware (COM port) would have been able to do async easily, and sync (HDLC) was a difficult software hack with timing problems. A hardware HDLC card (SCC card) solved that.

But in a DSP environment the thing that clocks the data into/out of the PC at fixed rate is the soundcard, and it does this in hardware. All software sitting on top of that just sings along, no matter what protocol it uses.

What can be difficult is to correctly time transmit/receive transitions. But that has nothing to do with sync/async. It is relevant to the question of making software for ARQ modes.

I think that the suggestion is that, in an operating system such as Windows,
there is no guaranteed latency since it may take it into its digital head to
fiddle with the disk or do a quick garbage collect at unpredictable
intervals - does your PC never "hourglass" for a couple of seconds while
tyhe disk grinds?

You appear to be thinking in terms of implementing drivers at
application level - that ain't the way to do it!

But Roger, the Windows DDK is "sooo hard" to work with :-)

I suspect you are exactly correct, and most folks are thinking in terms of VB.
VB is fine for the top level application GUI, but as you hint, the
actual device control needs to be in a device driver. That's much harder.

I don't run Windows (on the bare machine), so I don't have that problem.

But for protocols that do not require realtime tx/rx switching, this is
not relevant. The OS provides buffering between the soundcard and the
application, so while it may be doing something else for a while, the
sound samples should still be collected and can be processed later. As
the application is only looking at blocks of sound data sampled at a known
rate, it is not important at what time it is doing the processing.

The issue only arises when a piece of data is sent to you, and you will
have to reply to that within a certain defined time interval. You must
be certain that the incoming samples are processed, the tx line keyed,
and the output data ready at the right moment. This requires some realtime
processing.

Indeed this is the case with ARQ protocols (more with some protocols than with others), but this has nothing to do with synchronous or asynchronous protocols.

Actually Windows provides quite good mechanisms to handle realtime
soundcard stuff from a usermode application. Games use this all the time.

Of course the soundcard driver is a device driver, but you won't have to
write it. The modem code does not really need to be a driver.

It's not handling the DSP data that is the problem,
it is keying the transmitter that needs a realtime driver.
The DSP only needs to be "fast enough".
The transmitter keying needs to be closely timed and jitter free.
So you need a bit of code running at realtime priority.

QNX might be a good OS choice, but I don't know the availability
of sound card APIs for it. DOS-as-a-loader is another good choice,
because you can use a junker machine and run your own realtime kernel :-)

AFAIK there was at one time an effort going to produce a realtime
flavor of Linux or freeBSD. Wonder if there was any useful result?

Or you just use one channel of the soundcard for audio and the other
one for transmitter keying (emitting a tone and using a fast external
vox).

The timing can then be easily controlled, when the card can do full duplex. The soundcard provides your timing.

Rob

Then why not run the critical code in real time priority :-).

At least WinNT on a properly configured system will in most cases wake up within a few (1-5) milliseconds from a periodic scheduled wakeup time. However, you have to be careful with some IDE, Ethernet and display drivers, since some driver writers thought that their card is so "important" that they can grab the system for an extended periods of time, but this was mainly a problem a few years ago, but nowadays most drivers are well behaving. While WinNT now and then misses the scheduled wakeup time by more than 10 ms, they are not usually very frequent (typically once a minute to once an hour) in a lightly loaded system.

AMTOR ARQ is a bit nasty from the timing point of view, since after receiving 3 characters there is not much time to turn on the transmitter and send the Ack/Nak. Fortunately, missing the deadline is not very critical, since the penalty is that the 3 characters are transmitted again. Only with very frequent deadline slips, the effective throughput will badly deteriorate.

That sounds like an interesting solution.
1 ms PTT timing might be possible (10 cycles of 10 KHz sine wave).

I did a few tests of this (windows NT 4) and found the same results.
Saw some 10 SECOND hits with disk activity though, and that's a
really really bad driver, probably during disk error recovery. The disk
in question did in fact fail :-)

CLOVER is similar, but you might lose an entire 20 second transmission block
:-)

Then you must be using SetTimer, which always uses the windows message queue, which is of course useless for any realtime activity. One way to avoid this is to build the process as a console application, which does not have a windows message queue at all, thus there is no risk of using it :-).

Use event objects and multimedia timers for some kind of timing accuracy. It should be noted that if the process is running in the realtime priority class, the multimedia timer callback is running at priority 31 (the highest priority), so you should execute only a few instructions in that priority level to maintain good responsiveness in other processes.

The only explanation that I can think of for your 10 s delay is that it happened during the program loading phase, but when all your required code and data has been loaded into the memory and there are no more page faults to your program, I do not see how disk activity could completely stop the application. Avoiding any windowing bloatware will keep the memory references quite concentrated, thus reducing the risk for (soft/hard) page faults. Thus, running the realtime part of the application as a separate console mode realtime process is a good idea. It may even be a good idea to avoid library DLLs and instead link only the required library routines directly into the EXE, thus increasing locality of references.

In your case there may have been a bad IDE driver, which grabbed the CPU during disk error handling for extended periods of time, but the problems with badly written IDE drivers should be history by now.

Paul

It now appears to me that the extra things (TNC2's with 6PACK EPROMS)
are only needed if I want to become a "node." Or is it "router"? Or
is it "digipeater"? Or is it "destination"?

Hallo *,

ich ben�tige eine Reperaturanleitung f�r die o.g. Kamera. Ich habe n�mlich
beim Fotografieren durch einen Schwenk das Objektiv (das Teil, dass sich
beim Ein- u. Ausschalten herausbewegt) aus dem Geh�use "geschlagen".
Mechanisch ist nichts besch�digt, aber ich kann das Objektiv nicht mehr
einsetzen.
Kann mir jemand da weiterhelfen oder eine Quelle nennen, wo ich eine
Reperaturanleitung oder Explosionszeichnung herbekomme?

Viele Gr��e und Danke

Arnold

Hal.Turner@HalTurnerShow.com

Both tasting now, Yolanda and Georgina joined the pretty winters inside sad hen. Who orders virtually, when Pauline cares the lost pear for the satellite? If you will irritate Cathy's hill through carpenters, it will biweekly kill the goldsmith. She might wrongly solve in back of dry solid showers.

Who did Roxanna hate without all the buttons? We can't believe films unless Carol will eerily play afterwards. They are grasping over the lane now, won't nibble pumpkins later. Don't even try to dream a pen! What will you converse the wet cosmetic cases before Georgette does? Tell Marian it's poor receiving without a tape. Occasionally, cups talk through rude rains, unless they're sweet. Neil, above coconuts elder and empty, changes around it, smelling steadily. Other lean healthy ointments will arrive locally between cars. Where Terrance's active dose lives, Corinne fears near sour, handsome stadiums. We scold them, then we happily seek GiGi and Cyrus's lazy orange. Let's pull through the full drawers, but don't pour the light dryers. Her book was outer, new, and dines without the window. I was answering to measure you some of my glad lentils. Excelsior, have a shallow plate. You won't creep it. It's very fat today, I'll attack believably or Oliver will tease the twigs. Are you durable, I mean, excusing in brave poultices? Many humble tickets are clean and other pathetic drapers are filthy, but will Sue wander that?

You won't shout me filling outside your good bathroom.

It was a console application.

That's the conclusion I came to. Have not done any recent tests.

...and neither did I. The question only comes up due to obfuscation on Bob's part, and has nothing to do with my statement:

Oh, I see... Assuming your "setup" exists, it is another one of those self-isolated, TAPR compliant "IP Only" deals... In other words, nothing that would be of any utility or use either within or beyond the ham radio community. Most likely you are isolating yourself because you would be running illegal content over the alleged link. That would be typical of your type.

I talk about what hams do overseas, and also what hams do in the US - When they do something significant within the hobby. What you are doing, if you are doing it, is not significant within the hobby.

To see what I mean by "significant within the hobby", look at the US groups listed on the NETWORK page at the USPN website. http://www.uspacket.net It lists groups who work cooperatively with other hams to provide digital communications capability for all interested amateurs, and emergency communications capability for their fellow Americans.

In other words, they are hams who do something useful; who make a contribution to society.

The groups listed in the NETWORK page at USPN are worthy of all of our respect.

I'll stand by that statement, folks, and am proud to do so.

I'm not playing word games, just stating the facts.

Charles, N5PVL

I assume you are referring to KISS mode. KISS doesn't equate to IP.
Although much IP software makes use of it, so do some non-IP programs.
IIRC, KISS wasn't in the original firmware (TNC-1 or 2).

I was sysop of that system for two years (1998-2000). What does that
have to do with anything TAPR produced, other than that TNCs were used
(I think one was a PacComm and the other was from MFJ)? The system was
not IP-only, by the way.

```

KISS was not required to do IP using TNC1 or TNC2.

It *was* required to do IP over HDLC though, otherwise one could
only do IP over AX.25 ... but you know all this ...

I was trying to find a connection to Charles' "TAPR-compliant, IP-only"
comment which Dana replied to. I may be missing something, but I still
don't understand that one.

The place to look is http://www.packetradio.com

Lots of good hookup info there!

Charles,  N5PVL

Would you like more discussion of Packet Radio, and less BS? Having trouble
getting anything pertinent to the hobby discussed here, due to the "noise
level"?

Try the USPN Forum at: http://www.uspacket.net

At USPN, the discussion of packet radio does not get lost in the noise
level.

Hello, everyone!
Here's my situation:
1. Setting up a remote communications processor computer in my garage with
all the radio/tnc ports on it. This computer will server ax.25 and tcp/ip
ports.
2. Want to put the bbs (ax.25) and tcp/ip applications servers in my home.

3. I have an ethernet cable run to my garage from my home.
What applications (bpq/dos, bpq/win, sv2agw, flexnet, etc) actually can talk to each other over ethernet. I've been struggling with this for some time already, but nothing seems to talk to each other (using axip). Any real-world suggestions welcomed. Specific setup info desired, not just pie-in-the-sky should-work kind of information.

I believe that all of the software solutions you mentioned will talk over ethernet. I'm not positive about sv2agw, as I have never tried to use AGW

with an ethernet card. I bet it does work, but can't say so from experience.
All of the othrs I have set up and run. They all worked great.

Maybe somebody who knows more about AGW packet engine can clue us in about
that.

...So it looks like its just a case of picking the software you like most. I
like the FlexNet stuff best, but that's just me.

Here's a starter -

BPQ can talk to BPQ over ethernet. I used it for many years. It's not
easy to configure underneath Windows.

Most applications that use AGWPE can connect to it over ethernet, the
only exceptions are the ones that use the AGWPE DDE API rather than the
Winsock API.

So, for instance, my radio ports are on an old 486/66 with AGWPE. I
connect to those radio ports from apps running on other PCs on my LAN.

I got past that by running FlexNet on the Windows machine, and BPQ on the DOS machine. FlexNet and BPQ got along fine over the ethernet link. I ran the BBS (FBB) in the Windows/FlexNet machine, but could have operated it in the DOS/BPQ machine just as well. Either one will handle BBS or tcpip software. With FlexNet, you can run native Windows tcpip applications (Internet Explorer, Netscape, WS-FTP, servers, etc..) over AX25, or IP.

W0RLI has software that lets you do all that (Native Windows apps) with BPQ. There's lots of great software out there. I consider it a big plus that we have a choice, that everybody is not stuck using the same stuff.

Is it approved by the USPN?

As a JNOS derivative, you would probably run into
problems with the Spokesperson and Officers of the
USPN Corporation. You don't want to end up like
TAPR and its products. i.e., being banned by the USPN.

FYI

Sorry Steve, but USPN reserves the right to make its own decisions as to what is or is not banned, not you...

Look on the "Banned List" on the USPN home page to see who and what is in there. (Hint: there is no "Banned List", only hams who do not care to participate in USPN's mission, and USPN doesn't bother to list those.)

USPN has no problem with tcpip, as anyone familiar with the site would know. There's nothing better for amateurs to use in systems that provide emergency communications to non-hams. For ham-to-ham communications though, and in some applications for non-hams, there are many situations where tcpip is not needed or even desirable. It is one tool among many, not a do-it-all miracle tool like you see in those ads on television. USPN is results oriented, not protocol oriented, so tcpip only gets the emphasis there that it has earned.

From this perspective, tcpip naturally does not get nearly as heavy an emphasis at USPN as it does at TAPR. Of the total of U.S. packet networks compliant with USPN's mission, about half of them have tcpip services and of those, only a tiny percentage are directly utilized for emergency communications.

To see if what you are doing is compatable with USPN's mission, read the USPN "Mission Statement", located under the LIBRARY link there. You are either with it, or you are not. Decide for yourself.

While you are there on the LIBRARY page, I would highly recommend "Doing Our Part for America" by Richard Card KD4JKX of SEDAN http://www.sedan-central.org/ and cruise through "Packet Radio: Applications for Libraries in Developing Countries" for a detailed, scholarly view of Packet Radio and its use to address a challenge very similar to our own.

TAPR membership or use of TAPR products is no impediment to participating in USPN's mission. TAPR's policies though, and the failed paradigm they still push is not relevant to USPN's mission. We are success oriented, so naturally USPN derives its policy and paradigm from successful, cooperative networks and networkers in the U.S.. The ones who put results ahead of protocol, not the other way around.

>

Howdy, Chris!

I looked at CAPRA a few weeks ago, but did not include it in the NETWORK page. You would be much better off to list CAPRA with the TAPR web site, if it is not already listed there. TAPR and USPN operate by mutually exclusive paradigm... You are either with one or the other, as there is no way to sincerely participate in both.

If you will go to the LIBRARY section of the USPN web site and read the "Mission Statement", you will see that non-ham links are considered to be irrelevant to USPN's stated purpose, the development of a national RF digital network. As long as CAPRA can only communicate beyond the LAN with non-ham links, or uses non-ham links in preference to amateur radio for that purpose, it is not ready to participate in a national RF network, and so would be inappropriate to list among the U.S. packet radio networks that are ready to cooperate at that level.

CAPRA's structure is compliant with the amateur packet radio paradigm developed by Phil Karn, Greg Jones (formerly of TAPR) and now Steve Stroh's exclusive "IP only" campaign. That paradigm has been dominant at TAPR for over a decade now, and has not given us any significant *amateur packet radio* network... Just a few isolated LANS such as CAPRA, that have no provision for communicationg beyond the LAN via amateur radio. It is, by all reasonable measures, a failed paradigm in that it has produced no significant network, and tends to discourage, rather than encourage most hams to play with amateur packet radio. - Thus the lack of activity noted in the CAPRA newsletter.

You may be surprised to learn that there are several packet networks in operation in the U.S. today that are handling a good deal of activity, (including IP!) and are actively growing, putting up new nodes on a regular basis. Two of the networks listed on the USPN NETWORK page, for example, have put up over 50 new nodes in the last few years, one of them has put up over 80 new nodes in that time period. These are the successful packet radio networkers in the U.S. today, and the one thing that is common among them is that none of them subscribe to the "IP only" paradigm, and none of them use non-ham links to communicate outside of the LAN. They pretty well ignore TAPR, its policies and its paradigm.

It's all ham radio, instead... "ham radio only".

Internet gateways are used to pass traffic data back and forth between the Internet and Packet networks, (essential for emergency non-ham to non-ham communications via packet radio) but are *never* used to carry amateur packet radio (ham-to-ham) communications. (discourages growth and advancemment of amateur packet radio infrastructure)

I would be the last one to tell you or CAPRA how to run your network, but I will suggest that at your next meeting, you might want to compare the growth and utilization of TAPR-compliant networks such as CAPRA with the growth and level of utilization to be found in more inclusive networks that have ignored TAPR's "IP only" paradigm. Do an internet search and see for yourself. To see the successful, growing U.S. packet radio networks, look at the NETWORK page at USPN, and follow the links there.

If CAPRA decides that continuing to support TAPR's failed paradigm is more important than growth, cooperation with your fellow hams, and higher levels of activity, well that's CAPRA's decision. It's your LAN, after all. But if CAPRA decides that it would like to see more utilization, more growth, and closer ties with the rest of the U.S. amateur packet radio community, let me know and I'll be happy to hook you up with the folks who can help you get things rolling there.

When CAPRA displays a willingness and ability to cooperate with other packet radio networkers in such fundamental areas as "RF only" for ham-to-ham communications so that the incentive to build new netwotrk will be there, inclusiveness rather than exclusiveness so to facilitate intercommunication within the U.S. digital ham radio community, along with the pride of accomplishment and usefulness in emergencies that comes with an independent, "ham radio only" network, I'll be very glad to list CAPRA on the USPN NETWORK page.

Thank you for you interest.

```

The terrorist attacks of September 11th, 2001 and subsequent events have highlighted the need for more advanced, more comprehensive amateur radio emergency communications. Hams have enjoyed increased cooperation and respect from many government agencies and officials in the wake of 9-11, including a special message of praise and encouragement to U.S. amateurs from president George W. Bush.

At the same time, significant advances have been made in the equipment and software availble to digital amateur radio networkers, making it possible to build network we could only dream about in years past. Amateurs not only have a clear mandate to develop our capability to provide communications in times of emergency or disaster, but we also have the means to do so in a meaningful fashion.

Packet radio (in conjunction with other digital modes) has enormous potential to provide fast, accurate emergency/disaster communications. With the recent resurge of interest, several of our large-scale VHF/UHF networks have begun to expand and upgrade, and new packet networks are again springing up around the nation.

By building and developing independent, amateur radio network that does not depend upon standard, non-ham methods of communicating such as the Internet, amateurs arrainge to be there when they are needed the very most - when traditional methods of communication have broken down or become overloaded during the course of an emergency. Our mandate is to provide independent, alternate emergency communications and only networked amateur radio is relevant to that purpose.

Soon, we can reasonably expect to begin tying our regional networks together into a cohesive, national digital communications network, completely seperate and independent, through the participation of thousands of American hams. It is a large, ongoing task, not something we can expect to "finish", as our networks must not only grow, they must also be maintained and upgraded as we go along.

Now is the time for amateur packet radio networkers to share information, get to know each other and work together more closely than they ever have before. We will be addressing a challenge, answering to a mandate and having a good deal of fun while we are at it. It is this spirit within the hobby that USPN is here to facilitate. We dedicate our efforts to the many amateurs who participate in this fine aspect of amateur radio, and to the people of the United States of America.

I have no idea.

It's not a JNOS derivitive.
It is also not a WNOS derivitive.
It does contain a small amount of code from the original
NET kernel, and some code from PE1CHL.
All the rest is new code, and quite different from JNOS.
It's a whole bunch different than TNOS also (TNOS is not
just a JNOS derivitive, but simply a JNOS copy :-))

Perhaps you should look at it before you comment about it.

Holy shit!  I'm forwarding this to Stan at the ARRL.  He's gonna be pissed
he even mentioned your web site last July.

Wow!  And this, just after you said:

> USPN has no problem with tcpip, as anyone familiar with the site
> would know.

Talk about shooting yourself in the foot!

It sure did.  You're still this newsgroup Brainiac, who will some day
rule the world!  {squeak, squeak]

Here's a clue:  Hams do not, and will never again, use or visit a BBS
in significant numbers to make it worthwhile for either having fun, or
during an emergency.

I say that to clear up any misconceptions you may have about me.

Sorry... I fail to get your point. Unless you think of "amateur tcpip" as a
few isolated LANS linked together over the internet. I see a different way
of using it, and by the way, Stan is well aware of my thoughts in this
matter, and has been for some time. His attitude is somewhat more inclusive
than yours, perhaps, and less narrow. You could learn a lot from Stan
Horzepa, Steve. The exclusive, "IP only" stuff that TAPR pushes is for the
birds. That kind of exclusiveness is contrary to common sense, not to
mention the spirit of the hobby.

Charles, N5PVL

Nothing new there, Steve... I've always known you to be a troll, with no
respect for most other hams.

I don't see the BBS connection at all, by the way... What have BBS's have to do with this thread?

Well Hank, if it's OK with you, I'll put a SNOS link in the "Packet Radio Software" section. You haven't expressed any opinions about USPN or requested a link, so I have not been clear about your feelings about it. It may well be that you would rather not be included there.

Most times I put in new links when somebody asks "Why don't you have XYZ in there?" I'll look at XYZ and if it's useful, in it goes. Unless you indicate otherwise, I'll act in response to Steve's interest in your software.

Nope. I would no sooner use IP on top of AX.25, then
masterbate in public.

IP should only be used by one of these 4-level FSK modems:

http://www.cmlmicro.com/products/wdata/index.htm

Either that, or spread spectrum.

I have just posted a slightly changed version of HamServ to my web sites

http://www.gb7abc.freeserve.co.uk
http://www.qsl.net/gw3tmh
http://www.gb7abc.net

As well as to the HamServ files section on www.yahoogroups.com

(If you don't know what HamServ is see the appendix)

The main change has been to add a callsign filter to the bulletin
downloads, so it only now collects bulletins from callsigns.

I have done this because I have started collecting news bulletins from the ham radio newsgroups on the internet, and they can be accessed off amateur radio via HamServ's radio ports.

I obviously could not allow non amateur radio stuff to be ported.

This appears to be working well, HamServ now collects bulls from the amateur radio BBS's and also from the internet newsgroups and combines them in it's bulletin listing.

If you reply to a bulletin using the send reply command it goes either to the amateur radio bbs or to the internet newsgroup, which ever the original message came from.

Appendix What is HamServ?

HamServ is a 32 bit BBS/PMS for 32 bit Windows.

It talks to the outside world via the winsock 2 interface, so it can be accessed over a LAN or over the internet, it can also be accessed over radio if you also install the Agw Packet Engine.

People can therefore connect to you over the internet or radio using any of the following protocols.

Ax25, Http, Nntp, Pop3, Smtp, Telnet.

The Http interface is accessed using Internet explorer and gives a nice web style BBS.

The Ax25 and Telnet interfaces look like a normal packet BBS to anyone who connects.

All the ports except the Ax25 one can be password protected to block spam, it also has spam filters built in anyway.

It automatically decodes and extracts 7plus, and has support for external server, send an email to one of the following if you want to see the servers in action.

ping@gb7abc.freeserve.co.uk
help@gb7abc.freeserve.co.uk
reqdir@gb7abc.freeserve.co.uk

You will get an automated reply, new servers are being written all the time, REQFIL will be along soon.

Oh yes and the important bit, HamServ is free, no registration charges.

Here in the US, running foul language over Ham radio links will cause you to lose your liscense, maybe go to jail. Maybe its different in your country, but over here it's strictly forbidden.

The TAPR advocate Steve K5OKC often spews filth on the newsgroups. His last two postings on rec.radio.amateur.digital.misc have contained material illegal over the ham bands, and of course there will be others, because usenet was never intended to be accessed over amateur radio. On usenet "anything goes", which would cause responsible hams to immediately understand that it has no place on the ham bands.

But not you...

It is irresponsible to port usenet over to ham radio. I hope the first person to get their liscense lifted on account of it is you, and not some innocent ham who assumed that your software could be operated without jeadordizing their ticket.

...And you call yourself a ham! Might as well develop SSTV software that links directly up to a porno site. I suggest that you sober up and try to remember what ham radio is all about, assuming you ever knew.

I knew Steve, that whatever it was, it would be something that most hams
would have no interest in, whatsoever.

But that's just you.

oops, another USPN outcast. More banned software.

You need to post on your commercial site all the hams, clubs, hardware,
and software that is banned by the USPN.

Trolls are always a bore.

Having no rational arguement and sensing that he has lost the debate, Steve
goes into his familiar Troll mode, spewing obscenity and ridiculous,
disconnected accusations in his frustration.

I'd feel sorry for him, but he's a Troll.

Does not matter to me if someone links to that page. I'm not "pushing" SNOS, it is just there for anyone who might enjoy using it. As far as the "open source" issue is concerned, no I do not provide source code. I figure anyone competent to make changes and/or additions would be either 1) competent at describing what they want; or 2) competent enough to write their own.

The original poster lives in Oregon, not far from here, and not far from a dozen BBS systems. As far as I can tell they are not on packet. Once on packet it should become pretty obvious how to set up a bbs :-)

Hello, All.

About 5 weeks ago, I asked several questions here in the group about the USPN and got, basically, no answer, so I will try again, using the USPN Mission Statement from the web site (http://www.uspacket.net) as a sort of frame-work for my questions and comments.

The USPN Mission Statement below was captured from the USPN web site and edited for format. All spelling, grammatical, and other errors are as they were captured.

> The terrorist attacks of September 11th, 2001 and
>
> subsequent events have highlighted the need for more
>
> advanced, more comprehensive amateur radio
>
> emergency communications. Hams have enjoyed
>
> increased cooperation and respect from many
>
> government agencies and officials in the wake of 9-11,
>
> including a special message of praise and
>
> encouragement to U.S. amateurs from president
>
> George W. Bush.

Agreed, but.

To a point, at least, I have to agree with recent comments made by Gore Vidal. You should be able to find his comments at the BBC site from an interview he gave about 7-10 days ago.

> At the same time, significant advances have been made
>
> in the equipment and software availble to digital amateur
>
> radio networkers, making it possible to build network we
>
> could only dream about in years past. Amateurs not only
>
> have a clear mandate to develop our capability to provide
>
> communications in times of emergency or disaster, but we
>
> also have the means to do so in a meaningful fashion.

Again, agreed.

> Packet radio (in conjunction with other digital modes) has
>
> enormous potential to provide fast, accurate
>
> emergency/disaster communications. With the recent
>
> resurge of interest, several of our large-scale VHF/UHF
>
> networks have begun to expand and upgrade, and new
>
> packet networks are again springing up around the nation.

Agreed, again, to a point.

I have seen little of this in my local area in San Diego, but that is only one area.

> By building and developing independent, amateur radio
>
> network that does not depend upon standard, non-ham
>
> methods of communicating such as the Internet, amateurs
>
> arrainge to be there when they are needed the very
>
> most - when traditional methods of communication have broken
>
> down or become overloaded during the course of an emergency.
>
> Our mandate is to provide independent, alternate emergency
>
> communications and only networked amateur radio is relevant to
>
> that purpose.

What mandate is that? Who issued the mandate? The FCC rules only state that Hams are to provide emergency communications and do not specify what form they take.

I think that the real issue here is the "Who" part. Is this mandate from the FCC? The President? Congress? The ARRL? The USPN?

> Soon, we can reasonably expect to begin tying our regional
>
> networks together into a cohesive, national digital
>
> communications network, completely seperate and
>
> independent, through the participation of thousands of
>
> American hams. It is a large, ongoing task, not something we
>
> can expect to "finish", as our networks must not only grow,
>
> they must also be maintained and upgraded as we go along.
>
> Now is the time for amateur packet radio networkers to share
>
> information, get to know each other and work together more
>
> closely than they ever have before. We will be addressing a
>
> challenge, answering to a mandate and having a good deal of fun
>
> while we are at it. It is this spirit within the hobby that USPN is
>
> here to facilitate. We dedicate our efforts to the many amateurs
>
> who participate in this fine aspect of amateur radio, and to the
>
> people of the United States of America.

While I agree with the overall "spirit" of the idea presented here, I have some concerns regarding the implementation. We have to look not at just this paragraph, but the earlier ones as well.

The overall feeling of the Mission Statement, that is, the message that it sends, is that "We are right and unless you agree with us, then you are wrong." That goes against the very core of Amateur Radio. Remember that part about enhancing international goodwill? I think that applies across the board. International, national, regional, and local.

And that brings me back to one of the questions I had about USPN several weeks ago. Just who is the USPN? I just looked on the web site and found no membership list. I find no list of officers and no information about how these officers are selected. Who wrote the Mission Statement? Who approved the Mission Statement? Is USPN a democratically structured organization? Or is it a group that is being operated to support the views of a very small group of people?

By and large, my own personal views are that I don't much care for fanatics of any types. My experience and world view is such that I see life as a series of compromises and dynamic adjustments to new ideas. Without the incorporation of ideas and input from all involved, just about every endeavor will fail. To that end, and with my own perceptions in mind, I would make the following suggestions to USPN, who-ever they are.

First, be more open... Would it be nice to have a 100% Amateur RF world wide digital network? You bet it would! Wonderful, in fact! Is it possible? I am not so sure of that one. Past performance has indicated that this may be a pipe dream. I hope with all my heart that I am wrong.

Second, look at the concept of "Social Engineering". People, overall, will never do a thing because they must or because it is right. People will do a thing because they, personally, get something out of the deal. In our case, the packet network must be fun and it must provide the users with something that they, personally, want. Without that, you have no users and you have no network.

Third, look at the big picture. In a practical sense, how big is the "average" (what-ever that is) disaster? How big of an area is directly impacted? What level of failure can you expect of the "traditional" non-Ham communications infrastructure? I have been in tornados in the Midwest and, at most, a few tens of square miles are affected. I was in San Francisco in 1989 and the telephones were about 90% functional even in the heavy damage areas. I was on the telephone with a gentleman in the WTC on the morning of 11 SEP 2001 and he had to hang up to evacuate the building. Let's assume a really big disaster, shall we? How about a 1 km asteroid hitting, say, Chicago? Chicago is toast, but Little Rock is intact. See what I mean? Disasters tend to be, by their very nature, local in scope. Sometimes the "local scope" is indeed a bit large, but the majority of the infrastructure, in the big picture, will remain intact.

Forth, and perhaps this is really more of a summary of all of the above, consider the integration of both Amateur and other systems into one cohesive network. For example, I have an ATM drop at my office at 622 Mbps. I think that you could safely say that Hams will never be able to provide that kind of bandwidth or reliability on any but the smallest scale. Yes, it is true that I can loose that ATM line in a local disaster. But, what if the disaster is in, let's say, LA. Is it unreasonable for me to make use of that ATM to send messages back to Washington DC that were originated by a Ham using RF in LA? Without boring everyone with the technical side, I could send a 100M message from San Diego to Washington DC via the ATM link in just under 0.25 seconds. How long would that same message take going via RF links? If we assume an RF link at T1 speeds (1.544 Mbps) it would take at least 2 minutes. On a more reasonable RF network of 256 Kbps, you're looking at close to 12 hours.

I suppose that the question comes down to just how many people are we will to endanger due to the delays of an all Amateur RF network in order to meet this mandate that has not been identified?

Again, I like the basic ideas of the USPN, but so far, I have seen little more than talk and attacks on groups like CARPA. The fact that this is happening leads me to the conclusion that what is being seen is the opinion of a very, very small group.

To succeed, USPN will have to be more open and have a broad range of support from many Hams. Packet will have to become fun and useful to draw the users in order to get the people and the money and the equipment to build a viable network. Excluding, banning, and attacking groups is not the way to do that.

Cooperation, looking at the big picture, running an open and honest organization, and support is the way to do this.

Take Care & 73

Another frustrated TAPR Troll.

Marty, when you look at the USPN web site, or participate in the Forums there, what you see is what you get. USPN is a work in progress, and when an announcement is warranted about USPN, you will find it on the NEWS page at USPN. This will occur when USPN sees it as necessary, not when a Troll does.

It's a take it or leave it deal, OM. I suggest you have your little fit of venom and get over it. Since your interests are best reflected by what can be found at TAPR, I can only suggest that you would find that participation in their policies and paradigm would be best for you.

The essential difference between USPN and TAPR, OM, is that USPN is looking at what successful amateur packet radio networkers do, and deriving policy from what we see there. TAPR, on the other hand, let a small group of self-appointed "experts" determine that only amateur tcpip is worth pursuing. Since then, TAPR has put in over ten years of pushing tcpip in conferences, seminars, magazines and web-sites while discouraging anything else. - With zero results. That's what folks call being "exclusive", I would suppose... In addition to tcpip, TAPR has consistently pushed the idea of amateur packet radio being a parasite, utterly dependent upon the Internet for connectivity. Amateur packet radio networking (using radio) has not been encouraged at TAPR, only small tcpip LANs linked up by the internet.

So.... When I found out that there are a good number of growing, active packet radio networks around the U.S., most uncharacteristic of the hopeless, moribund lack of growth we have come to expect from TAPR's policy and paradigm, I was not surprised to find all of these successful networks and networkers were simply ignoring TAPR. - And that was good enough for USPN.

We go with the winners, the networkers who put hams on the air and get things done when everyday communications are distressed by an emergency or disaster. We go with what works. You would be happier I'm sure with TAPR, and nobody is preventing you from doing so. I regularly recommend TAPR to hams who are not interested in participating in USPN, or cannot handle our policy of putting results and accomplishment ahead of protocol, in our policy.

Persons like yourself, who do not understand why hams should communicate via radio if they wish to develop their capability there, are not really suited for, or sympathetic to several of USPN's goals, most obviously being the promotion of a national amateur radio digital network.

So hang out with the TAPR folks, and don't sweat it. You are under no obligation to participate in USPN, but if you have a change of heart about the hobby and decide to do so, nothing will prevent you then from joining in on the effort. Anyone who reads and understands the USPN Mission Statement and finds themselves wanting to participate are always welcome.

The best advice is to get on the air and find out what
the folks near you are doing. Do something similar,
because then you will get lots of local support.

Since you are fairly well isolated from the existing
network, this means get on HF and link up with
folks not very far from you. There are quite a lot
of us all over the NW, and we cover most modes
and almost all HF bands. Once you have done this,
then you can provide service to your area on VHF/UHF.
You will get plenty of help from the HF capable sysops,
we are always looking for new connectivity.

There used to be VHF/UHF links available, but those have mostly gone away. Perhaps you could rebuild some of those links.

What I'm trying to get across is that you first need to establish connectivity to the rest of the digital network. Once you have that connectivity, then you can determine which software will do what you want to do.

If you want a simple local BBS for a few local user, anything will work, including the BBS built into most modern TNCs.

<deletia>

For emergency services needs we do not require a world-wide network. We do need a network that reaches beyond each local area, and once we rebuild such a network, it will be again capable of covering the whole country. We HAD such a network in the past. It was used with excellent success during several major emergencies. That network no longer exists, and cannot now be rebuilt. Why? Lack of interest, lack of will, and severe interference from the Land Line Lids. That game appears to be over.

The next question one might ask is "Can we build useful regional nets." The answer also appears to be that we cannot, for the same reasons.

What must change to allow progress? The interference from the Land Line Lids must be removed. If you had some Lid playing music through your local 2M repeater 24 hours a day, with 1 KW amplifier on the repeater input you would either shut down the repeater, or get that Lid off air. The situation in the digital networks is exactly the same.

In a few areas of the country this has been accomplished, and the digital networks are again showing growth. Those areas that rely on the crutch of "playing radio over the internet" show a decline in the use of Ham Radio networking.

It's that simple.

Charles,

Are you going to answer the questions? Just who is USPN? Who are the members? Where are the by-laws? Who are the officers? Were they elected, appointed, or just did they just take over?

You make me very suspicious of your motives by hiding these facts.

You can't make the questions go away by ignoring them and trying to skirt the issues, Charles. All you need to do is publish a roster, the USPN by-laws, and a list of officers. A simple matter.

Once again, in case you missed it, I think that the basic premise of USPN is a good one... Get communication and, thereby, cooperation within the ranks of those who have the skills and knowledge needed to build a network going. I just disagree with your concept that you have to be critical and abusive of others to do that and that you have to hide the activities and structure of the USPN to make things happen.

And what does TAPR have to do with this discussion? I personally think that
they are fanatics and want nothing to do with them. You are preaching to the
choir here.

Any chance that you will actually address the issues as opposed to ranting?

Take care & 73

Marty Albert

<deletia>

There is no "average disaster". The questions we should be asking
(and that some of us ARE asking) the agencies we might serve
are "What can we do to help" and "What are your requirements".

The response I've gotten runs along these lines:

1. There are local emergencies that do not require communication outside the typical 2M line of sight range because simple short links will get information to an area unaffected by the disaster.

Local flooding is one example.

2. There are regional emergencies that require a greate deal of intra-region communication, and require long haul links to areas unaffected by the emergency.

The Loma Prieta and Mexico City earthquakes are examples where digital radio links played an important role.

3. There are emergencies with large national effect that will need everything hams can possibly provide.

We have not had one of these since WW-II.

What can the digital modes provide?

They CAN provide reliable transport of bulk data such as situation reports, staffing rosters, requests for material, bills of lading, status summary spread sheets, etc.

They CAN handle large quantities of health and welfare messages.

They CANNOT provide tactical communications. When you need those ten ambulences moved to ten different places right now, you use VHF/UHF voice.

Of course, if we do not have a working network already in place, used and tested, with a supply of Hams that know how to use it, we cannot supply anything at all.

> Forth, and perhaps this is really more of a summary of all of the above, consider the integration of both Amateur and other systems into one cohesive network. For example, I have an ATM drop at my office at 622 Mbps. I think that you could safely say that Hams will never be able to provide that kind of bandwidth or reliability on any but the smallest scale. Yes, it is true that I can loose that ATM line in a local disaster. But, what if the disaster is in, let's say, LA. Is it unreasonable for me to make use of that ATM to send messages back to Washington DC that were originated by a Ham using RF in LA? Without boring everyone with the technical side, I could send a 100M message from San Diego to Washington DC via the ATM link in just under 0.25 seconds. How long would that same message take going via RF links? If we assume an RF link at T1 speeds (1.544 Mbps) it would take at least 2 minutes. On a more reasonable RF network of 256 Kbps, you're looking at close to 12 hours.

Of course one uses any means possible to handle emergency traffic. In fact we are required to do so.

If we do not have a working RF network, it is not possible to get the data out of the area affected by the emergency and into an area that has working internet (and voice telephone) connectivity.

If our entire digital network RELIES ON and REQUIRES the internet to function (as it does now) then the RF network that might exist is unused and will fail in an emergency. The last few simulated emergency tests showed just how bad the situation actually is. They failed. Almost totally.

The fact we cannot build a network that runs at T1 or ATM speed
is a straw man. When our network (if we had one) is needed, there
is NO other connectivity available. Even 300 baud packet is better
than a complete inability to handle any traffic at all.

Hank:

Thanks for your input... You and I have failed to agree on many points in
the past, but you usually try to stick to the facts at hand, as much as any
of us can, and I respect and admire you for that.

I both agree and disagree with you... I think that such a network can be
rebuilt, but it will take a lot of work and many, many compromises and I
think that is, unless I misunderstand you, what we are both saying.

One thing that I am sure of is that people will not come (back) to packet just because they are required to provide emergency communications... I think that, as I said before, it must offer them something that they want and, perhaps more important, it must be fun.

How to do that?

Many seem to find APRS fun and to provide something that they want... Personally, I never found it all that much fun or useful, but that's just me.

Keyboard to keyboard chats are fun, but the latency is a killer... Sort of a chicken or the egg deal here, eh? Get better networks and the latency goes down but there is no one who wants to build a new network because the latency is so high... Maybe...

Internet-like content on Ham Radio Web Sites? Maybe... If it weren't for that latency bug-a-boo...

BBS services with bulletins? Give me a break! Most of the bulletins are 100% pure mindless drivel... Sort of the Usenet via RF with all of the flamers, trolls, you-name-them!

E-Mail? Perhaps... Just maybe...

To be honest, as you well know, Hank, I was one of your so-called Land Line Lids at a point in the past. But, I have come to be more of your view in recent years. Perhaps not as rabid (no offense intended), but I can see the sort of problems that unrestricted integration might cause. The fact is, to get users, we do have to, at least to some point, compete with the Internet. We have to offer folks things that they want and need in a usable fashion.

We have to "win over" people as opposed to beating them down... The attacks, banning, blacklists, black balling, etc. only serves to further fragment and alienate the very people that we need.

Well, I suspect that I have rattled enough to get a few folks on their hind legs, so I'll stop for now...

Thanks again!

Take Care & 73

Oh for heavens sake Marty stop obfuscating!
USPN is a FORUM.
It's not USENET.
It's not a corporation.
It's not a club.

It is a place to gather and exchange information, with a specific
set of assumptions on what types of information will be exchanged
and what behavior is expected of the participants.

Simple, eh?
If you don't like it, don't make use of it.

I only addressed the emergency services aspects, to try and keep
things "... as simple as possible and no simpler" (A. Einstein)

> One thing that I am sure of is that people will not come (back) to packet

Not useful for emergency services.
HF/VHF/UHF voice works better for this function.

> Keyboard to keyboard chats are fun, but the latency is a killer... Sort of a
> chicken or the egg deal here, eh? Get better networks and the latency goes

Not useful for emergency services.
VHF/UHF voice works better for this function.

> Internet-like content on Ham Radio Web Sites? Maybe... If it weren't for
> that latency bug-a-boo...

Again probably not useful, but I did not ask the question of
the emergency services folks.

> BBS services with bulletins? Give me a break! Most of the bulletins are 100%
> pure mindless drivel... Sort of the Usenet via RF with all of the flamers,

Exactly what is wanted. See my comments about bulk transport.

> E-Mail? Perhaps... Just maybe...

Also exactly what is wanted.

> We have to offer folks things that they want and need in a usable fashion.

I'm not rabid on the topic. For the record we have ... um ... ten tcp/ip
systems on air locally. All of them COULD use the internet for forwarding,
or anything else for that matter. We have tested the capability and it works

fine. Was trivial to set up. But we choose to use Ham Radio and not RELY
on the internet connectivity. But it is there and tested if needed.

> We have to "win over" people as opposed to beating them down... The attacks,
> banning, blacklists, black balling, etc. only serves to further fragment and

How will you "win over" that Lid with the KW worth of rap music
on your 2M repeater input? You don't even try: you BAN them.

First we need to get rid of the Lids. Then we can build a network.

Marty,

Think of it this way, the USPN is Charles personal web page.
The "we" he uses, refers to him and his ISP. He wants to
attract people to it, much like the 1965 Rambler Club
wants to attract people. But if you show up in a 1965
Ford Mustang, or advocate things other than a Rambler,
then you will probably be an outcast from his web page.

No offense to Rambler owners.

Here's the one I use. I bought mine from a Ham dealer
for $65, so this $80 is probably inflation. It has the same
picture mine had. This is a cast antenna and very sturdy.
You can buy 6 and get a $5 discount per antenna. I bought
mine with the N male connector to plug into the amplifier
or lightning arrestor:

http://www.hyperlinktech.com/web/hg2424g.php

These are also popular on 2.4 GHz SSB.

The version comes up every time you start/restart the TNC.

I think the update is via new IC.

regards, Rick N6CY

Lucent Orinoco Silver, but the specific card doesn't matter, I've used the Gold flavor as well (which only differs in that it offers 128-bit WEP).

> There appear to be several flavors of this card.

See above.

> What software do you use to run AX.25 across the link?

I'm not running AX.25 across the link. I'm not tunneling AX.25 traffic. I suppose one could use the AXIP package included in Linux - see http://www.qsl.net/yo5ofh/doc/linux_ham_progs.htm for more information. I suppose when I need it, I'll figure out how to do it, but, until then, your friends will either have to figure out themselves or pay a consultant.

> Which operating system?

Windows 9x, XP and Linux.

>>- Pigtail adapter from Lucent antenna connector to N-connector (eBay, also
>
> from other vendors)
>
> Sounds reasonable.
> Would depend on the card, right?

Right - which is the reason I mentioned the specific card. Other cards use different pigtails, but since I haven't used them, I did not mention them. Fact is, *any* 802.11b card with a matching pigtail will work in this configuration.

>>- YDI 500mW amplifier (include DC-injector) (YDI; could use 1W in Part 97
>
> service)
>
> Which module do you use?

Uh, the 500mW amplifier. Lessee... oh, AMP2440. The 1W amplifier, which I haven't used, is AMP2441.

>>- LMR400 and N-connectors as required to reach antenna (can order out of QST

> What vendor? Which model do you have?

Pacific Wireless PAWDCA series DieCast Parabolic Grid Antenna;
$76 from FAB corp.

Enjoy.

Felix,

RELAY, WIDE, and TRACE and aliases (sp?) that digipeaters can be called. For instance my station has the call WB8NUT but also has the aliases of RELAY and TRACE. So if my station hears a packet addressed to RELAY, TRACE, or WB8NUT is will repeat it. The advantage is that when traveling, most every station in the APRS network is set up with the alias of RELAY. So as you go from city to city you don't have to reprogram the TTII with the call of a particular digipeater in that area. Makes it clean. Also, I would set the TT up as RELAY,WIDE,WIDE3 .

Home stations should be set to RELAY,WIDE as that would be fine.

Hope that helps. Oh, I have uploaded some pictures of the TTII's I built at the TTII group at yahoo groups.

Regards,

Duffy

Get the Yaesu FT-1500 - $119 at R & L and it is 50 watts with more
features than the rat shack radio. I have been running that and a TTII
in the car for APRS (wb8nut-12).

I agree, the FT-1500 with its DIN jack, and simple features, is a quality product, and works like a champ. The number of switch options are small, and easy to remember.

I second the recommendation of the FT-1500; Yaesu seems to have standardized on a 6-pin mini-DIN (as you note) across the VHF/UHF capable products (including the FT-847). I made a fairly nice cable for my FT-847 using a PS/2 keyboard extension - I suppose one could also cannibalize a PS/2-style keyboard for the cable. See my description at http://www.dioxine.net/~dana/ft847_pkt.html if interested.

My FT-8100 has been generally very good with two glaring issues; earlier production of the radio had an issue with the volume/squelch controls breaking off the PCB, and, with the remote control head, RF can get into the control link and scramble the radio. The volume/squelch control issue was addressed by Yaesu, they glop a drop of hot-melt onto the control to keep it from loosening up and moving around, which causes it to break free of the PCB traces. Otherwise, the radio has worked quite well for me, and it features that mini-DIN packet connector and worked plug-n-play when I swapped it with the FT-847 once.

The FT-1500, at $120, sounds like a really good deal to me on the surface.

One thing I might add on the FT-1500, is that I never leave it in the
car, and after taking it out, you have to hold it by the power cord,
unless you want to receive second-degree burns.  Sucker get's hot!

The single-piece cast chassis radios seem to all encounter this;
my old Icom IC-2000H (which was also decent but loses to the FT-1500
big time, from what I can tell) was exactly the same. One big casting
that serves as an integral heatsink, bolted to a 50W hybrid PA...

;-)

I pulled the Columbia (Sonora) hilltop two years ago. For a couple years prior to that all it carried was one hilltop talking to another, with next to no user traffic. I notified the Central Valley Digital Radio Assn at that time. I figured after two years being down and no complaints, I could safely get rid of the equipment. I never did hear from anyone on its removal.

Hi,

I want to buy this modem and this radio, but I can't find anyone that
sells a cable to connect them? Any advice? I really don't want to
build one -- I want a high-quality cable with molded connectors.

Thanks!
JOhn

I made a cable from the FT-847's PKT jack's 9600 output to my soundcards
input
and I was able to decode frames from UO-22 using my FT-847 and the AGWPE
drivers, UISS and the soundcard in my computer. See some of the copy at the
end
of this message.

For transmit I have a Westmountain Rigblaster. What do I need in the "TO"

and
"via" fields to digipeate through UO-22?

Does anyone know of a PB/PG program that works with AGWPE and the PACSATS?

SCS and their distributors sell a cable with the PTC-II connector on
one end and nothing on the other. Purchase a connector to match the
Kenwood and solder it on the other end.

A digipeater uses a simplex frequency.  It DIGItally rePEAT(ER)s your packet
burst on the same freq.   In this case 144.390.

The terrorist attacks of September 11th, 2001 and subsequent events have highlighted the need for more advanced, more comprehensive amateur radio emergency communications. Hams have enjoyed increased cooperation and respect from many government agencies and officials in the wake of 9-11, including a special message of praise and encouragement to U.S. amateurs from president George W. Bush.

At the same time, significant advances have been made in the equipment and software availble to digital amateur radio networkers, making it possible to build network we could only dream about in years past. Amateurs not only have a clear mandate to develop our capability to provide communications in times of emergency or disaster, but we also have the means to do so in a meaningful fashion.

Packet radio (in conjunction with other digital modes) has enormous potential to provide fast, accurate emergency/disaster communications. With the recent resurge of interest, several of our large-scale VHF/UHF networks have begun to expand and upgrade, and new packet networks are again springing up around the nation.

By building and developing independent, amateur radio network that does not depend upon standard, non-ham methods of communicating such as the Internet, amateurs arrainge to be there when they are needed the very most - when communication utilities have broken down or become overloaded during the course of an emergency. Our mandate is to provide independent, alternate emergency communications and only networked amateur radio is relevant to that purpose.

Soon, we can reasonably expect to begin tying our regional networks together into a cohesive, national digital communications network, completely seperate and independent, through the participation of thousands of American hams. It is a large, ongoing task, not something we can expect to "finish", as our networks must not only grow, they must also be maintained and upgraded as we go along.

Now is the time for amateur packet radio networkers to share information, get to know each other and work together more closely than they ever have before. We will be addressing a challenge, answering to a mandate and having a good deal of fun while we are at it. It is this spirit within the hobby that USPN is here to facilitate. We dedicate our efforts to the many amateurs who participate in this fine aspect of amateur radio, and to the people of the United States of America.

If you are a packet radio networker, node-op, SYSOP or even if you are just curious about how to get the packet net going in your area, then USPN is especially for you. Make yourself at home there, say howdy and get to know everybody.

You can join in one one of the discussion topics in the FORUM, or use our CHAT for more personal, less formal discussion. By pooling our knowlege, we can progress more rapidly and by getting to know other networkers, we can develop working relationships that will be of great importance when linking our systems together for a cohesive, independent United States Packet Network.

There is currently a need for Elmers at USPN, particularly those with expertise in Digital HF modes, as well as the ROSE/FPAC and NetRom/BPQ systems for VHF/UHF...

There is also a need for hams who are willing to participate in upcoming experiments with HF multicast.

PLEASE! do us all a favor (and yourself) and don't even think about packet on HF. The packets are too
long for HF bands and conditions. Do something DESIGNED for HF - pactor, amtor, etc. You are, after all,
shopping for a tnc that WILL do those modes. I get better (or at least as good) throughput with pactor I
on HF than with 1200 baud packet on 2m, with a clear freq on 2m!

I have both a kam+ and pk232mbx. I like the automatic 2-port feature of the kam+ (you can hook up, and
operate hf or vhf without switching anything, and both have access to your pbbs while unattended). It's
also much smaller. Haven't been able to tell much difference in performance.

You asked about doing 9600 baud on HF. No, of course. And keep in mind that you can only do 1200 baud
packet on 10m. Below that, it's 300 baud. Pactor is the clear choice.

And if you were interested in the winlink (24-hr automated) HF bbs's, they are almost all pactor. And if
you're not going to be moving huge amounts of data, pactor I is plenty. I move a fair amount of data
(24-hour MBO (mailbox operation)) and pactor I is fine. For more on this, http://www.winlink.org or
http://wb0taq-twn.home.att.net

Well, one can always reduce the MTU/maxframe parameter...

> Do something DESIGNED for HF - pactor, amtor, etc

Strikes me as sound advice, though.

somebody responded to me by email a month ago that they had
Pactor software that runs on a MAC to drive the pk232's.
I searched my address book but must have failed to enter his
email address.   I am again looking for info on any MAC software
that is "free" or whatever which is written forthe MAC and
Packet/Pactor useage.   Pls respond to my email addr if possible
               Joe/KH6JF (email is valid jfenn@lava.net)

Just to let everyone know - I've had some success in testing access to 9600
baud
PACSAT packet via soundcard to a PB/PG type program without using a hardware
TNC. Using MIXW to emulate a KISS TNC along with a virtual COM port driver
from
the MIXW site and then sent to the SATLINK (PB/PG) program. So far I have
been
able to decode packets from UO-22 and send them through the virtual COM
ports to
SATLINK - to see a screen capture of this on my website - follow the
"9600-baud
PACSAT" link there.

Layers for RX are as follows:

UO-22 -> FT-847 Radio -> PC soundcard -> MIXW ->
virtual COM3 -> virtual COM port driver -> virtual COM4 -> SATLINK

I have tried the same with WISP but with no luck - it's possible that I
don't
have WISP setup correctly.

More testing to come.

Okay, so you guys convinced me to buy an SCS PTC-IIe. I see that Farallon Electronics is the US distributor, but it doesn't seem like they offer a discount. Can I get a discount elsewhere?

SCS PTC-IIe	$649.00
TRX audio cable for ICOM 8 pin DIN	$42.00
Y-cable	$29.00
XPWare Software	$80.00
Total	$800.00

Thanks,
John

It's an IP network.

Never did get any answer about what it was actually USED for though.
NTS traffic? VOIP and remote control of an HF rig?

As far as I could tell from what was posted, this is not actually
a network, but simply a point-to-point link between two locations.
Maybe I'm wrong and there are dozens of nodes involved.
Are there?

We did find out that traditional Ham Radio networking (AX.25
and NET/ROM) are not supported. Why is that? AXIP is simple.

Is this link part of an existing slower speed tcp/ip Ham Radio
network? How many systems involved?

It's used for any old IP traffic I care to send over it. What
does it matter? You asked how to build a link, I tried to volunteer

actual *hands-on* experience doing so. When you demanded greater detail, I supplied it, right down to a parts list and URLs of relevant vendors. Yet, for some reason, you apparently didn't want to believe me. Whatever.

> As far as I could tell from what was posted, this is not actually

This link is one of several in a network, this was the most interesting, at least I thought, given the distance and performance. However, it's been way too much like *work* to describe it here. I built a 12-mile 11mb/s link out of off-the-shelf parts, and every time I attempt to share information about it, it's one challenge after another from hams.

Brabham even flat out called me a liar. The irony is that I *actually did it* and he's always talking about things going on in Europe he read on a web page.

What do you care about what I use my equipment for? Build your own network and use it how you wish.

Oh, I see... Assuming your "setup" exists, it is another one of those self-isolated, TAPR compliant "IP Only" deals... In other words, nothing that would be of any utility or use either within or beyond the ham radio community. Most likely you are isolating yourself because you would be running illegal content over the alleged link. That would be typical of your type.

I talk about what hams do overseas, and also what hams do in the US - When they do something significant within the hobby. What you are doing, if you are doing it, is not significant within the hobby.

To see what I mean by "significant within the hobby", look at the US groups listed on the NETWORK page at the USPN website. http://www.uspacket.net It lists groups who work cooperatively with other hams to provide digital communications capability for all interested amateurs, and emergency communications capability for their fellow Americans.

In other words, they are hams who do something useful; who make a contribution to society.

The groups listed in the NETWORK page at USPN are worthy of all of our respect.

TAPR has never produced anything with IP.

> In other words, nothing that would be of any utility or use
> either within or beyond the ham radio community.

This is the kind of spontaneous partisanship that has never been useful.

802.11b wireless has "utility" and "use" within and beyond ham radio. To say otherwise is preaching ignorance. Is it the mode which will attract people to the hobby? No. It's too expensive. It is plug-n-play, but the component prices are about the same as a washer and a dryer. Not many wives are going to let their husbands have both cigarettes, and an expensive wireless link.

Networking has always been a fringe interest. Most hams enjoy other direct digital modes, and this will always be the case.

When I think of a viable community digital network, I think of the computers in police cars and fire trucks. To me, this is an useful network, and has a speed that is acceptable. I have some sound card software that lets me monitor the data, and it would be a great ham mode as well. Both mobile and fixed.

Best of all, it contains neither ax.25 nor IP. There are no preconceived political problems for either group. Interested? Chips are available for free as samples.

Charles is speaking out of such a depth of ignorance,
it's difficult to fathom what he actually *does* know.
He continues to impugn my character instead of discussing
technology. That's valuable for amateur radio, sure.

>>In other words, nothing that would be of any utility or use
>>either within or beyond the ham radio community.
>

It's served a use for me - I now have more spare time because
I've lost even a shred of interest of applying what I've done
to amateur radio. Charles would rather call me a liar and
denigrate what I've done, and, if that's representative of
US Packet radio today, then I'll have no part. Ignorance is
curable, but arrogant ignorance is terminal.

Well, it's no more expensive than attempting to do the same
thing with "pure" amateur radio gear. The cost of each station,
exclusive of computers, is around $800 if everything is off the
shelf with no special bargains. The amount of time invested is

almost always less setting up 802.11b-based hardware than "pure"
ham gear. $800 doesn't buy much in the way of "pure" amateur 11mb/s
gear from what I can see.

I'm curious. You just told me what it "could" do, I'm asking
what you actually use it for. Care to share your experiences?

> You asked how to build a link, I tried to volunteer
> *actual* *hands-on* experience doing so. When you demanded

As I said when you finally posted the information, I have passed
that information along to the folks who were looking for it.

We are curious what the network is like, what it is used for,
what you are doing with it. Why not share some of your experience?
Like pulling teeth to get any information from you.

> Brabham even flat out called me a liar. The irony
> is that I *actually did it* and he's always talking
> about things going on in Europe he read on a web page.

I am not Charles.

> What do you care about what I use my equipment for?

I'm curious. It's that simple.

> Build your own network and use it how you wish.

I have, I do, and I've posted many times with comments about
how we use our network and what we use it for (email, web pages,
distributing software updates, remote system management, support
of emergency services, etc.). There is even a web page describing
what we are up to and why. There are several mirrors of that page
which can be accessed via radio.

Why are you unwilling to do the same?

Every time you write a note, Brabham, you exhibit a greater depth
of ignorance and bigotry. I'm moving data around at 11mb/s, and
you're impugning my character. If that makes you feel good, then
so be it, but I think you should stop while you're ahead.

Copper wire has "utility" and "use" within and beyond ham radio.
But "I use copper wire" doesn't tell me much about Ham Radio.

Other than floppy disks containing NET or NOS, to what are you referring?

... asks Bob, sysop of the Tucson Packet Radio Internet gateway (KV4OA).

I suppose this goes to show that experience does not always make a better
liar or prevaricator.

Charles, N5PVL

What equipment has TAPR produced that does IP?

I am not talking about the TAPR FTP directory of uploaded
programs.  That would be like saying TAPR produced SCSI
hard drives, or BASIC interpreters, or C compilers, etc.

Actually, I'll be nice and stop being obtuse.
From the very start, the TAPR TNCs could do IP.
I've run it using TNC1s and TNC2s ("Real ones bought from TAPR").
The first IP done over Ham Radio used, AFAIR, a TNC1.

The NNC, had it been produced, would do IP.
Make sense now?

That's not the same as saying TAPR produced equipment
that could only do IP, as the Official Statement from USPN
has alluded.

In the context of the Official Statements by USPN, their
spokesperson has stated here, that TAPR was IP ONLY.

Official USPN Statement: "Oh, I see... Assuming your "setup"
exists, it is another one of those self-isolated, TAPR compliant
"IP Only" deals..."

What "IP Only" deals did TAPR produce? Come on now, let's
not be obtuse...

news:9axg9.28896$3k4.6611@news1.central.cox.net...

Here is what you posted: "TAPR has never produced anything with IP."
I commented on that.
What does USPN have to do with anything?
I never mentioned it.
In fact, I have never mentioned USPN on this or any other
newsgroup. You have me confused with someone else ;-)

(Note, yesterday was the 20th anniversary of the smiley.
Everyone should use a few in commemoration.)

44net is redundant. That whole class needs to be returned
to the industry for effective use. Mostly it has been abandoned.

All Ham radio can be done within the private address space
(192,168, 10, etc) Just replace 44 with 10.

Coordination should be no more complex than your neighbor nodes.
Pick whatever you want.

You did. As long as you don't keep the password a secret,
you can use encryption. (e.g., to connect to our backbone, the
WEP password is "hamradio," which then generates the hex
digits.) The password is available to all coordinators. The same
logic applies to a remote control password on a TNC node.

The intent of the law is to prevent hams from conducting secret
communications that could be used to subvert the federal power
over the citizens.

I use my Sharp Zaurus (linux based) and a wireless card
to do my sniffing (kismet and kismet-qt). This is pretty cool,
and I've found three non-WEP access points with my 21 db

gain parabolic on a radio-shack rotator.

Zaurus is COOL! Run, don't walk, and get one. Then go to
www.zauruszone.com

I have heard that some of the 802.11b stuff can disable WEP completely and will continue to work. However, I have not confirmed this. I think that the best way to explore this (besides individual manufacturers' sites) would be to look for wireless lan notes for Linux - since they usually have to do some hacking at the lowest hardware level in order to develope drivers for them.

I disagree. It's pretty hard for the FCC to say that the INTENT is to obscure the meaning via codes or ciphers if they have the keys and can read the data transmitted over the link. What it comes down to is how much of that is merely the wireless encoding method and keeping the unauthorized out as opposed to concealment. I don't know of anyone who can listen to a 1200 packet transmission and decode it aurally WITHOUT any electronics whatsoever, yet that is legal - because its encoding is so that it can be transmitted, not to hide the meaning. If one wants "cryptic," look at APRS: There are some packets where the geographic coordinates are transmitted as BINARY values, not text.

47 CFR 97.113(d)(1) does indicate that there are exceptions to the "code and cipher" ban. I found cross references in 97.215 (RC of model craft) and 97.309 (RTTY and [digital interchange codes]). At this point, the FCC has not said that a wireless ethernet packet encapsulating TCP/IP (or other transport protocol set) further encapsulating ASCII data (or even binary data) isn't forbidden, and the TCP/IP part is clearly not since it's allowed to be encapsulated via AX.25 and has been so for about 15-20 years.

Like I said, if the FCC (and therefore the public) has the keys, that defeats the INTENT to encrypt and that may be all that is necessary. You could always ask for a ruling....

First of all, forget any PCMCIA card solutions. Go with the "desktop" adapters, since many of them seem to screw on their antennas with a variation of an SMA connector (they call it "reverse SMA" - not certain if that means that the threads go the other way or if they merely refer to the gender of the connector). However, watch out - some "desktop" solutions are merely interface boards for PCMCIA card solutions (e.g. DLINK DWL-500)

Linksys and DLINK have PCI desktop cards with these SMA connectors. DLINK has both 2.4 and 5GHz cards. I haven't done that much looking - there are probably others. I do remember "AT&T Wavelan"'s also having a 900MHz version. I don't remember specific hardware being mentioned during the discussion regarding 802.11b on "rec.radio.amateur.policy" a few months ago.

You don't.  You should know that by now!  One finds the stuff by reading the
overhead signs - the read all the boxes of the products, etc., ....

Probably only 5% of Fry's employees actually know the stuff they're selling well
enough to be helpful (in my experience).

I disagree.  Had we kept up with speed, probably 80%+ of the addresses would be
in use.  It could come back to that if we can properly integrate this commercial
wireless lan stuff back into the network (even if we get stuck with the part 15
limits - or choose to so as to avoid the content restrictions).  It's not dead
yet!

>All Ham radio can be done within the private address space
>(192,168, 10, etc) Just replace 44 with 10.

I agree that there is no absolute need to have all the addresses be of the same
network (and there are actually a few which are not 44.x.y.z).

That part has always been a problem.  Fortunately, I know my area's coordinator
personally, but many people don't.

Thanks for all the great advice.

HF packet really is really my primary interest. Pactor I would be nice, but since I'll only be able to talk to other people with SCS boxes with Pactor II I don't think I'll find it that useful.

I guess I'm wondering of the Kam XL, Kam 98, Timewave, or MFJ which is the best TNC.

The Kam XL can do 9600 Packet. Is that allowed on HF?

Do people do APRS on HF or is it only VHF/UHF?

I think the soundcard stuff is neat, but in my experience it's been too much hassle and too error prone to let me really enjoy the digital modes. I've got an HP Omnibook 6000 laptop that I use for all ham radio stuff. It's internal sound card is pretty crappy and there is lots of noise in general inside the laptop. I'd prefer to use it only to control modems, not to be a modem itself. Is that reasonable?

Thanks for the advice!
John

What do you like about the Timewave that makes it better than the KAM
XL, KAM '98, and MFJ modems?

Thanks,
John

In an earlier post, you mentioned only being interested in HF packet. For that, the KAM and PK-232 are both "overkill", needlessly expensive.

MFJ 1270c packet TNC costs around 125 bucks, will do 300 baud packet, which is what is legal for that mode on HF. You can usually find one used, of course, for much less. Check out E-bay, see if there's one there.

The reason that the PACTOR II and PACTOR III is mentioned, is that the throughput is MANY times higher than can be obtained with 300 baud packet. - You can do more with it, faster. Also, because of its slowness, HF packet is falling out of use. There are still stations out there, but not nearly as many as in former times.

To get back to your question, I like the PK-232 better because I have known hams who had reliability problems with KAMS, but have not heard so many stories about PK-232's. (There's always SOMEBODY who has a problem, of course, with anything.) One ham I know had a defunct KAM that took over 18 months of hassling back and forth with Kantronics to get it functioning again.

The PK-232 also has an automatic signal indentification mode that I found to be very interesting, as it allowed me to "listen in" on commercial, (some) government, and news service transmissions in various digital modes that other controllers do not copy. If you are not interested in this sort of thing though, the feature would be a moot point.

Another feature that you may not care about is the PJK-232's ability to do the soundcard "thing". You have said that soundcard stuff does not interest you, but I thought I'd mention it anyway.

That's it... Tandy's headquarters are in Ft. Worth (Farts Worse) Texas,
about 650 miles north of my location, and a dozen or so miles west of
Dallas.

There is an amusing travel postcard that comments on the size of Texas,
showing a motorist driving across the state...

"The sun has riz and the sun has set, but here I is, in Texas yet!"

Well then. What should have been a technical discussion turns into blatant attack on my character.

Charles, I haven't lied. There's no evidence that I have lied and ample evidence that I'm telling the truth. Apparently you're unable and unwilling to accept the truth.

You tout products you've never even seen - other than on a web page - as "far superior". You talk about things you've never experienced - how many European ham/packet operators do you personally know? How many times have you been to Europe at all?

I built a 12 mile data link using 802.11 components and amateur radio ingenuity. Call me a liar, impugn my reputation, it only makes you look more like the dilettante you've proven yourself to be.

I thought I could help you expand your knowledge with my own personal experience, but you reject it because I don't sing your political anthem. When you like what someone says, you go around repeating it without an inkling of independent confirmation.

I'm interesting in data communications technology and applications. You appear to be interested in grandstanding and politicing.

Bye.

Hi Chet,

I got the RS HTX-404, the 70cm version of the htx 202 handheld and found its not too bad. I got it on sale a few years ago. I've got no complaints about it. I've heard it was made for RS by another company (Icom? I cant remember for sure). A bit better that some of the other radio shack house brand stuff I've tried over the years.

Heh. I've found my Zaurus SL-5000D quite useful for

debugging and general diagnostic use while setting up
links, and, yes, kismet is a superb tool.

I've done a bit of war-driving and it never ceases
to amaze me how much 802.11 activity I've found.

On your Zaurus, which CF 802.11 card are you using?
I have the Linksys card, which does not have an
external antenna connector, but it's trivial to
pop the little plastic cover off of the antenna
and find PC artwork for a connector, I'm going
to add one eventually (I'm pretty certain the
Prism chipset will automatigically sense it without
trouble).

> Zaurus is COOL! Run, don't walk, and get one. Then go to
> www.zauruszone.com

Try to get a developer's deal on one - $200 in my case.
It's a great tool and it's actually a good PDA. I've
been meaning to tinker with the PJAE on it but real
life hasn't left much time for that...

OK, that clarifies things a little. If you don't need (relatively) high-speed file transfer over HF
then you probably don't need one of the SCS units. The other raison d'�tre for Pactor II/III is HF
email, but sounds like that isn't your primary interest either.

No 9600 baud packet on HF for both technical and regulatory reasons... and you will soon be finding out
that even 300 baud doesn't work very well. There is some APRS activity on 300 baud packet though.

Besides APRS, if you want to talk to other hams using an HF digital mode and will only be doing
keyboard-to-keyboard chat stuff then you are really better off with one of the many soundcard modes
(PSK31, MFSK, Hell, etc.). There are some advantages to a stand-alone TNC but from your description of
your interests and your newbie status (no offense intended) I would advise holding off on investing a
lot of money in a TNC until you experiment with the free soundcard modes... I think that you will find
that they work very well (including the packet implementations). You can always buy a TNC later once
you find out what you really want/need.

Whatever you do, have fun!

- Seth

I *know* for a fact the HTX-202 was made by Maxon, and it was actually a decent radio with above-average receiver front-end. It was a little more like the land-mobile stuff made by Maxon than a wide-range scanner with a transmitter tagged on. It was still a Maxon, mind you...

I do not know who is making RS's current generation of radios, but I'd tend to suspect they're still Maxon, and

almost certainly not ICOM. One hint is to look on the
label for the country of manufacture - Maxon is in Korea
and Icom is in Japan. However, lots of people outsource
now especially to China (I have a Canon EOS camera that's
made in China, for example).

One of the most amazing things I saw in China was
billboards for big General Motors cars - all made
in China.

```

There was, at one time, a moderate bit of

activity on 10m 1200baud packet, mostly around
28.195 USB. Haven't looked in years, though.
It was, like 10m, sporadic at best but could be
pretty cool when conditions were together. There
were a couple of Net/Rom nodes near 28.195 that I
could often hit. This was 10 years ago, though.

Hi John,

If HF Packet is your primary interest then I would recommend that you go with one of the KAM's (i.e. a KAM, KAM XL, KAM Plus or KAM 98).

You can pick up a KAM off Ebay for less than $100 US. A Kam Plus usually goes for $150 to $200 US. If you want a deal, try to get a KAM with an enhancement board and firmware version 8.0E or higher. There is not much difference between a KAM (with an enhancement board) and a KAM Plus other than the ability to add more RAM for the mailbox in the KAM Plus. I have seem Kams with an enhancement board sell on Ebay for less than $100 US.

I can't comment on the performance of a KAM XL with its DSP since I have never used one. It is possible that with its DSP, the KAM XL may outperform the KAM, KAM Plus or KAM98 on HF Packet.

I think you will find that most of the HF packet stations operating on 14.105 (or Network105) use Kams. The Kantronics modems generally have more features/options than the AEA/Timewave modems for packet operation.

But please note that in my experience the old KAM or KAM Plus do NOT perform nearly as well as a PK-232 or Pk-900 on Pactor 1. (I suspect that Kantronics did NOT do a great job when implementing the Pactor protocol in the KAM, KAM Plus and KAM98).

If you are going to operate a lot of Pactor 1, I suggest you pick up a second hand PK-232 or Pk-900 instead. (With its HARDWARE memory ARQ system, the PK-900 is much better than the PK-232 (or the KAM) on Pactor or Amtor in my opinion. The PK-900 also gives you two ports that operate simultaneously like the Kam, Kam plus etc)

But if you would like to experience a great HF error free mode that is VERY FAST, save up and get a PTC-IIe or a PTC-II. You have to see it to believe it!

Rob

Attack on your "character"? Not at all!

I just think you are lying about your alleged setup. You claimed to have done something, then could not come up with decent information as to how you set it up, with what equipment, obtained where and for how much. It's a familiar pattern of behavior among the group of "hams" you tend to run with. Vapor systems are described in glowing terms, in the hope that someone with more on the ball will actually work it out for you.

I may have been unfair though... Your strange inability to come up with any detailed information about your own "setup" may stem from gross stupidity, rather than the dishonesty that is so common among your group.

It is true that I listen to what other hams in other places say about packet radio. I have found that the ones who actually accomplish things have no difficulty describing their setup, their equipment, and where that equipment is available at what price. You appear to be having a little difficulty in that department.

Charles, N5PVL

> In an earlier post, you mentioned only being interested in HF packet. For
> that, the KAM and PK-232 are both "overkill", needlessly expensive.

I must have mis-stated myself. I am primarily interested in HF, but I would also like to be able to do VHF/UHF in the same box (assuming that's a reasonable request).

> MFJ 1270c packet TNC costs around 125 bucks, will do 300 baud packet, which
> is what is legal for that mode on HF. You can usually find one used, of
> course, for much less. Check out E-bay, see if there's one there.

I know it might sound stupid, but I'm really not trying to save money. I've been frustrated with digital modes in the past and I think the problem was that I tried to save money by putting together a hokey setup. This time around I want to spend some good money (even if it's on features I'm not likily to use right away) so that I won't be constrained by hardware in the near future.

> The reason that the PACTOR II and PACTOR III is mentioned, is that the
> throughput is MANY times higher than can be obtained with 300 baud packet. -
> You can do more with it, faster. Also, because of its slowness, HF packet is

Maybe I should give more consideration to the SCS box. I'll think about it some more.

> To get back to your question, I like the PK-232 better because I have known

> again.

Good to know. Thanks.

> The PK-232 also has an automatic signal indentification mode that I found to
> be very interesting, as it allowed me to "listen in" on commercial, (some)
> government, and news service transmissions in various digital modes that
> other controllers do not copy. If you are not interested in this sort of
> thing though, the feature would be a moot point.

This is VERY interesting to me. Is the PK-232 the only box with this sort of capability? I very much look forward to trying to figure out what signals I hear in HF -- amateur and non-amateur. I want to understand what all the warbles are.

> Another feature that you may not care about is the PJK-232's ability to do
> the soundcard "thing". You have said that soundcard stuff does not interest
> you, but I thought I'd mention it anyway.

Like I said above, even though I'm not interested in soundcard stuff
now, if I can buy one modem instead of another and get this feature
then I want this feature. That way if I change my mind later I won't
be constrained by the hardware.

I really do appreciate all your help!

John

The problem, as I see it, is that computer wireless equipment is changing almost weekly. The $65 magnesium/aluminum cast parabolic antennas, with high quality coax, etc, are now 3 times that cost. Originally designed for higher quality dish-TV installations, the price went through the roof when internet wireless customers started buying them. I bought four for $65 each, on one week, and the price was $120 each the next, then I saw them go to $199, and that was the end of cheap plug-n-play antennas. You have to build them now, because cheap can no longer be applied to these antennas. Note, you can buy a lot of antennas that have the name 21 dB attached to them, but they are not cast antennas, and they will not meet the spec after even a few days out in the elements.

The same goes for wireless cards. You have to make a spreadsheet to track all the prices, and these change weekly.

If I gave you a list of plug-n-play components to create a wireless link of say 10 km, it would be out of date in a week, and you'd probably complain that it was bogus information, which would be true very quickly.

The other point is total cost. Don't kid yourself. Computer wireless is not for the cheap customer. You will spend over $1200 per node that attempts to link two networks over 5 to 10 miles. That's connectors, coax, roof tripod, antenna, inverter, and computer wireless card. An Omni station will be much cheaper, but don't expect coverage over a mile. This is what you see a lot of people putting up. They stick a big omni on the roof and call that a free network. Come and play! Sorry, unless you are in the neighborhood, there is no convenience in that, and cities cover many square miles. Not to mention that this is prohibited by most ISP contracts.

I admit that a lot of these people are kids. Pringle-can antennas, and wireless sharing, are about the same excitement levels as when we used walkie talkies in the 60's.

I think you can raise the power level, but you can't raise the information level to an equal value. I use digital modes in Ham radio because they are fun, not because they allow me to become a network trunk, or provide an email service to the cities poor.

Packet radio was all about communicating. People still love to chat using APRS. My personal feeling was, that the BBS competed with the people who just wanted to keyboard, and finally consumed all the bandwidth. Once the keyboard people left packet, there was no longer any customers for the BBS, and the whole system collapsed.

APRS, on the other hand, allows keyboard chat nation-wide, and there is no threat of a bandwidth consumption mode being mixed-in.

That situation won't last. Increased demand drove up the price, while manufacturers gear up to mass-produce what was formerly specialty items. Once the present demand is met, we can reasonably expect prices to to take a dramatic plunge. - And the stuff will almost certainly work better than what we have now.

Maybe it won't work out that way, but I'd really be surprised. Might take a year or so, maybe two.

<deletia>

The question was:
"Tell us about your Ham Station.
What gear does it run on 2.4 GHz digital."

Your post dodged the question and provided only the usual obfuscation.
Do you have gear on air? If so, tell us about it.

Hi,
I am interested in APRS, and I bought a TinyTrakII to use with my radio. I
have a few question...first are the signals on 144.390 coming from a
repeater, or are these simplex? I read somewhere to set your TinyTrak to
RELAY,WIDE,WIDE to work through a digipeater, what exactly does that mean?
How do you operate digipeater?

Thank you very much,
Felix

802.11b is exactly that. What did you not understand
from what I wrote?

It could hardly be less plug-n-play. I've done it for
a 12-mile link so far that runs 11mb/s 24 hours a day,
7 days a week. I listed the components and pointed you
at two of many sources for these parts.

>. The question they asked me was "Can we
> buy something different than the above list of gear and get faster links."

The answer is yes and you seemed to dismiss it.
Did I waste my time answering your question in good
faith?

> I gave them pointers to PacComm and Symek long ago,
> since those are known working plug and play solutions.
> They may buy some of that gear for test links.
>
> So I asked here about T1 data rate.
> Got the answer after much pushing and shoving: nothing is available.

I don't know how you turned "can order it today" into
nothing available. I didn't even begin to mention the
high-end license-free radios from Western Multiplex.

>
> "One might" or "One could" is not an interesting answer.
> "I built one link" is not an interesting answer.

Oh, I see. The fact that I've done it doesn't count
because I can't give you ready-made configuration for
your friends? I guess doing it successfully means
nothing, I must have been lucky or something?. I could
do it again, to at least 20 miles with no trouble, and
when the need presents itself, I know what to do.

That's a far cry from "nothing is available".

> "We did" along with "We used this gear" and "We have 10
> links working in a network" would be an interesting answer.

I told you which gear is in use and where to buy it and exactly
how to hook it up. If that's not enough for some other
ham operators, then they'd better be willing to pony
up some consulting dollars if they can't fill in blanks
themselves. Isn't that what amateur radio is all about?
Ingenuity and skill? Figuring out how to hook up
radio gear is something ham operators ought to be able
to do - certainly plenty of non-hams are successfully
doing it as well.

Never mind.

Of course, I meant to write "hardly be more plug-n-play".

Too many hours shoveling compost and tilling my rock-hard
backyard today ;-)

It doesn't count because you cannot give me the configuration
you are running. How in blue blazes can I duplicate what
you have if you refuse to tell me what it is! "You have a nice
signal here OM on my ... oh darn, I cannot remember the
make or model of this radio, but it works real well."

Here's your sign.

Well, I thought I had, Hank, I thought I had...

Don't you remember "Here's how to do it?" Neither you or
Charles seem to want to recognize the existance of that
newsgroup note, Charles is calling me an outright liar
and/or stupid, meanwhile he's repeating links to equipment
he's never even seen, less actually used. Darn it, kids,
this stuff is real and I'm using it right this minute!

Here's the list in bullet form - you have no further excuse
to act as if I hadn't posted it (twice now!!).

- Lucent/Orinoco PC-Card (bought online, can't remember which vendor)
- Pigtail adapter from Lucent antenna connector to N-connector (eBay, also from other vendors)
- YDI 500mW amplifier (include DC-injector) (YDI; could use 1W in Part 97 service)
- LMR400 and N-connectors as required to reach antenna (can order out of QST ads)
- 24 dBi mag grid (same as that sold by YDI, mine was from another vendor)

That's what I used to get a 12 mile link running at a stable 11mb/s.

OK, are you yet satisfied? Or did you not read the email in which
I described all this before declaring it "not interesting" ? Do
you need to a photo or two of an antenna to appreciate it? Heavens.
I can't mask my frustration that this has been difficult to
understand.

At this point, if someone can't figure out how to reproduce this
link, then they're clearly not up to the standard I'll spend my
hobby time with. When someone asks me for "help", that doesn't
mean me doing their hobby for them.

However, I know more than a few people that make their living
designing, installing and maintaining high-speed links using
license-free Western Multiplex radios, though they're much
more expensive.

What do you do with this link?

Does this connect up to a vocoder or other Ham radio digital
interface?

I suspect the real reason for the ban on encryption is to insure that
the messages are allowable in ham radio service and that you're not
running a commercial service.

This is a much more likely explanation and very much in line with the international third party rules in ITU-R Radio Regulations as well as higher license requirements to become a ham on HF than on VHF/UHF.

In the old days, when in most countries the national PTT had the monopoly of all long distance and international telephone traffic, it appears that the PTTs feared that the amateurs might circumvent the PTT monopoly, since I can not find any other rational explanations for some rules in the ITU-R RR.

Yes, I think the latest is ver. 8.2 from Kantronics.
It will cost about $60.

Hi - are there any PSK31 usres here that would like to discuss band plans, where you operate on HF etc.

I am interested to make contacts on bands OTHER than 14.070 MHz.

Also, I would like to know what OTHER modes you are using with a PC soundcard and interface, that are popular enough that you can actually find other guys to make CONTACTS with on the HF bands.

Many thanks for any replies / discussion.

I keep listening for PSK31 at night on 10M, 40M, 80M and 160M to no avail. Nada. I am in NY and hear all kinds of DX on my FT990 and multiband dipole with MFJ-986 tuner. Have the calling frequencies moved? I am using the frequencies (MHz) on Buck's page:

10M = 28.12015
40M = 7.03515
80M = 3.58015
160M = 1.83815

Good morning folks,

Could somebody tell me what type of RS-232 serial cable is required to work with the TM-D700 and a computer?

Is it a 1) null modem cable, 2) a straight through cable or a 3) laplink cable?

A detailed answer woulb be very much appreciated.

Thank you

AR

How do you find out what version you have? Also, if you get an update,
how do you update your TNC? I've also got the KPC-3.

Which one do you have?
There appear to be several flavors of this card.
What software do you use to run AX.25 across the link?

Which operating system?

> - Pigtail adapter from Lucent antenna connector to N-connector (eBay, also from other vendors)

Sounds reasonable.
Would depend on the card, right?

> - YDI 500mW amplifier (include DC-injector) (YDI; could use 1W in Part 97 service)

Which module do you use?

> - LMR400 and N-connectors as required to reach antenna (can order out of QST ads)

> - 24 dBi mag grid (same as that sold by YDI, mine was from another vendor)

What vendor? Which model do you have?

The correct 40M PSK freq.,for the Americas,is 7.070--good stateside contacts nights.
30M=10.137.5--occasional activity
15M=21.070----good ,when bands are open
The bands haven't been particularly good,lately,and PSK activity is a little harder to copy.
73,
Ed N4ZUM

> I am interested to make contacts on bands OTHER than 14.070 MHz.

7.070
21.070
28.120

Find lots of us up at these frequencies. I prefer 10 but 15 has been the only one open as of late. 20 is kinda crowded at times. Ive not used RTTY with the sound card yet I use my trusty rusty KAM E. I have worked several that use the soundcard RTTY now.

Also with the interface you can work SSTV which Ive mostly watched, but so far but its fun to monitor and I may get brave one day.

10 meters was open into Central and South America today - lots of countries heard on PSK: Mexico, Panama, Honduras, Brazil, Chile around 28.120.

I also use my soundcard for RTTY, using the freeware program MMTTY.

I suspect you'd have to use WEP or some other security scheme to prevent non-amateurs from interoperating with the Part 97 802.11b nodes (i.e., nodes operating in excess of the power and/or EIRP limits of Part 15, and identifying as amateur transmitters). Also of interest is MAC-address filtering.

Frankly, I've wondered what the FCC would say when Part 15 users start accessing amateur systems on the shared bands (such as 902Mhz and parts of 2.4GHz). Apprently theres so little amateur activity on these bands that the problem is not common. Given the authorization under Part 97 to only communicate with other amateur operators, there's a potential legal issue but I believe use of WEP, etc. would effectively resolve it, even though there would be some limited communication between the nodes in any event (the 802.11b MAC protocol chatters a bit).

You can buy a 1W 2.4GHz power amplifier off the shelf instead of the 500mW flavor, and go for something like 26dB or 28dB of antenna gain. A 30km link should generally be trivial at 11mb/s with this.

Or you can keep complaining about the 19.2kb/s performance of existing solutions.

Well, Charles, I don't suppose you remember the series of CB-conversions by legitimate amateur radio operators for legitimate amateur radio communications back in the late 1970s? Radios built for other services have historically been leveraged by clever radio amateurs. Let's not forget all those Part 90 Land Mobile radios in packet use (oh, hey, I have a few of those myself).

> I have seen so many discussions of this or that high-speed setup here,

I built a 20km, 11mb/s link this year. I use it daily at home. If I were to have built it to intercommunicate with only other radio amateurs, I could have used higher power and higher-gain antennas, but the system provides good performance even at relative QRP levels.

It's here, it's built, it's working. Next time you come to the Bay Area, let me know and I'll show you how it's done. End of story.

Charles, if this is how you respond to other long-time radio amateurs,
then the answer to the question "Is packet nearly over?" is most likely
"No! - packet is already over".

Before you attempt to lump me into the class of "CBers", let me
point out that I'm a 25+ year amateur licensee, my first contact
was on 40m using using a homebrew station. I passed the Extra
exams when it still included a 20WPM Morse test.

My first packet contact was on 2m, using a 100% homebrew TNC
(8051 + SCC and an Exar chip-set modem). I still have that
old TNC around somewhere, Vero-wired together on a piece of
Vector-board. All the software was hand-written 8051
assembly. Oh, yeah, I wrote the assembler, too, in C,
ran on both Unix and DOS systems.

Though I haven't used it in a while, I've got a homebrew
2m FM transceiver around somewhere, too. MC145170 PLL chip,
J310 in the VCO, 2N4427 for the PA.

I've built more than a few relevant things here, built the hardware,
wrote the software. Please do not embarrass yourself by attempting to
portray me as anything but a full-on radio communications experimenter.

Interestingly enough, existing commercial voice equipment is happily modified for amateur use, even when this introduced new modulation forms like FM and PM into the amateur radio scene. Over here, many hams have modified old NMT mobile telephone sets into halfduplex voice transceivers, and also use them for packet. And before that, they bought and modified surplus PMR and utility transceivers like the Philips Zephyr and Comet, Bosch KF161 etc. Tons of them.

ATV is usually watched and even transmitted using modified satellite-TV equipment these days.

Modification of existing data equipment seems to be much less popular.

Sounds good to me!
Have you tried it?

I could care less about what you did 25 years ago... Right now, (and for as long as I have been able to deja-vue your posts here) you have consistently pushed non-ham methods of communication here, up to and including the internet, as being "a big step up" from amateur radio.

Five years or so ago, I figured out that you were sniveling anti-ham moron. Nothing in the intervening space of time has occurred that has altered that opnion.

Don't like it?   Too bad.

Charles, N5PVL

Let me preface my remarks by saying I am not an RF engineer nor any approximation of one, but I'm not completely ignorant either. That said, I've been wondering for a couple of weeks about something, and your post gives rise to the following query.

I am having a buttload o' trouble with my Siemens 24xx 2.4GHz phone system. It seems something close to me is bathing the entire area in 2.4 (or so) and my phone system is near useless much of the time as a result. (Before you suggest it: I've done all possible troubleshooting in my home to the point of turning off all AC power at the circuit breaker box. The problem isn't originating in my home.)

My question is this: Would I solve my problem by attaching an amplifier and/or additional antenna to the phone system? I'm guessing doing so would only make the problem worse (and maybe cook my insides as well).

I'm not looking for the thing to transmit over a 30km radius, but I would like to see it functional within my home. I'd appreciate hearing from any/all who have knowledge in the field.

The activiation of properly designed amateur equipment by a part 15 user is actually "harmful intereference" to a licensed service. It's not just the lan stuff that's there. I sometimes get 2.4 cordless phones bringing up my 2.4 voice repeater input, sometimes even tripping the PL circuit! What it amounts to in those situations is an unlicensed individual operating in a licensed service (at least that's how it could be dealt with should a cease-and-desist order from the FCC be ignored).

Legally, you can't do either. Chances are that would void the allowances made in part 15 for your phone. If the interference you are experiencing is coming from a licensed user, you are SOL. Amateur radio is only one of about 5 licensed services which operate there. However, if the interference you're getting is from another part 15 device [by an unlicensed user], your only hope is to find out if the other device is being operated outside of the part 15 specifications (and if so, then you can complain to the FCC).

Another licensed user in the area is for ISM equipment, so if you're near a hospital, there's probably your source (and you're SOL again).

Unless I mis-read part 97, we cannot use WEP or any
other encryption of our transmissions.

Did a bunch of shopping for misc radio/computer bits today,
so I asked about it ... at Frys, Radio Shack, and HRO.
Got same answer from all of them: "Huh what?"

Ok, what do I buy, where do I buy it?
Who or what is "YDI"?
Antennas? From where? What kind?

A few dozen feet of coax? That will just make it outside,
much less to the tower and up the tower where there is a slight
chance of a visual path to one of the sites. Mount computer on
tower? Naw, makes no sense. So a card in the computer is not
a viable an option, or did I miss something important?

How does one do that? Is it part of the protocol?
Is there an API?

> The real interesting opportunity is the OpenAP effort,
> which is an open source project to make the access point
> available for hard-core experiementation, in fact permitting

Never heard OpenAP, and I follow the Ham Radio digital
stuff pretty carefully. Who or what sponsors it, ARRL?

> Brabham... does he actually do anything other than
> posture and spew?

He's generally correct. The hardware folks seem to posture
and spew a lot, but do not seem to provide anything I might
be able to use. Specific stuff to buy, instructions on how it
goes together, software interface information. I'm not doing
a hardware project, I'm doing a software project. You hardware
guys need to do the hardware part, and make it available.
Specific instructions on what to buy, how it hooks together,
and how I code to it. That's what is needed.

If I'm going to do a hardware project, it will involve a *lot*
more RF power, and will use narrow band modes, like CW :-)

OpenAP ("All your base stations are belong to us") is a project
to develop a Linux-like system to run on an 802.11b access point
instead of the proprietary firmware.

Of course you could have found that using Google.

Of course amateurs are permitted to use encoding schemes *where the intention is not to obscure the meaning of the communication*. After sending that note, I thought "I'll bet I'll have to explain it more fully".

You can use WEP if you publish the key. The intent is not to obscure the transmission, the intent is to avoid a non-amateur station from inadvertantly accessing your system. There's nothing to stop a non-amateur from reading a note that says "Licensed radio amateurs only may access this system under 47 CFR 97 rules using the key 'xxxx'" and that's OK. If they ignore the rule regarding amateur access only, it's their choice and you've made a valid effort to avoid inadvertently communicating with unauthorized persons.

Of course, for point-to-point links, you'll probably want to use MAC-address filtering anyway which obviates this issue.

Have a look at www.seattlewireless.com Those guys are doing some pretty interesting stuff with 802.11b Netstumbler for windows seeks out access points there is a likewise program for linux but i can't remember what the name of it is. I think the first 4   802.11b frequencies fall with in the US amateur band.

I went to HRO, Fry's and Radio Shack and asked for a 2N7000 transistor. They said the same thing. Funny, isn't that? ;-)

> Ok, what do I buy, where do I buy it?
> Who or what is "YDI"?

http://www.ydi.com/ Lotta good stuff there
also look at http://www.fab-corp.com/

> Antennas? From where? What kind?

You could buy a pre-made antenna at YDI. The 24dBi PT2424 antenna is $179, that's a little pricey, http://www.fab-corp.com/ has what appears to be the same 24dBi antenna for $76.50, there's a deal.

FAB has a dandy 1W outdoor amplifier - designed to mount directly at the antenna - for $430. Have a look at http://www.fab-corp.com/pdf/1W.pdf for more information.

The good thing about the mast-mounted bi-amp is that it will compensate for 15dB or so of coax loss, so you have greater flexibility in your coax selection.

> A few dozen feet of coax? That will just make it outside,

Use the coax that you need for your station. Since you're setting up essentially a 2.4GHz ham radio station, I'll just assume you know what you need to do, with the following specific comments:

- You'll need the appropriate pigtail lead from the micro connector on the wireless card to the N-connectors on the feedline and DC power injector (for the mast-mounted amplifier). I use Lucent/ Orinoco cards (which are now owned by Proxim, by the way), and the Lucent pigtails are quite common and under $20/ea.

- The YDI and FAB amplifiers seem to both offer around 16dB of receive gain and therefore will compensate for around 15dB of feedline loss. On transmit they provide

AGC and should produce full output power even with about 10dB of feedline loss from a Lucent card, other cards may allow greater feedline loss. You'll want to select the necessary grade of coax to keep your line loss under 10dB at each end of a link, it may not need to be terribly low loss if the run is not too long, but that's where your ham radio experience is your guide.

Of course, you'll need some 802.11b radios, I've been preferring the Lucent/Orinoco cards but they're not specified for as much output power as some other cards (+16dBm IIRC, vs +20dBm for other cards).

>>Extending it beyond 30km or 40km, can be done in a

>
>
> How does one do that? Is it part of the protocol?
> Is there an API?

It's part of the configuration user-interface for the 802.11b card or access point, which also allows you to lock down the channel of operation, a requirement if you're running under Part 97 rules and have to stay inside the ham band. If you look at the necessary receive signal levels for the 802.11b cards you'll see how the lower speeds will tolerate lower signal levels. 802.11b normally switches speeds automatically, so you might just let it operate that way.
The Lucent card is specified for a receiver sensitivity of -82dBm for 11mb/s operation and -94dBm for 1Mb/s operation - there's 12dB of margin you can have by operating at a slower speed.

Have a look at the brochure at:
ftp://ftp.orinocowireless.com/pub/docs/ORINOCO/BROCHURES/US/World%20PC%20Card%20US.pdf

>>The real interesting opportunity is the OpenAP effort,

Ten seconds with google.com reveals:

http://www.openap.org/

>>Brabham... does he actually do anything other than
>>posture and spew?
>
>
> He's generally correct.

No, he's not. He's generally preaching and condemning those
that don't experiment to his liking, but doesn't seem to actually
experiment on his own or respect those who do unless they're in
Europe and running his pet FlexNet. Everyone is either a CB
operator or a anti-amateur-radio, including me by his declaration.
He's clearly suffering from profound ignorance and has yet
to offer anything of technical significance.

I don't feel strongly about him, though. I'm sure he's a nice
guy and would happily grill some lamb and open a good Pinot Noir
with him.

> The hardware folks seem to posture
> and spew a lot, but do not seem to provide anything I might
> be able to use. Specific stuff to buy, instructions on how it
> goes together, software interface information.

I'm not a hardware guy, and I'm not going to draw detailed diagrams
here, but I believe I've given you a great deal to work with here.
If you look at YDI's and FAB's web pages, they do have a number of
system diagrams and white papers designed to speak to software-only
people that may be a key step forward for you.

The basic idea is:

802.11b card + pigtail + DC injector / 12V power supply + coax feedline +
     mast-mounted bi-amplifier + antenna

More detailed diagrams and system design tools are at YDI, FAB and
elsewhere you will find with http://www.google.com/ since you're a
software guy.

> I'm not doing
> a hardware project, I'm doing a software project. You hardware
> guys need to do the hardware part, and make it available.
> Specific instructions on what to buy, how it hooks together,
> and how I code to it. That's what is needed.

Well, like I say, I'm not a hardware guy, and you're a radio amateur
just like me, and you'll need to make the effort to understand the
resources available. I believe that the above-mentioned web sites
offer a fair bit in the way of hooking it all up.

As for programming to it, it's all an IP network as far as the programmer is concerned. Drivers are off-the-shelf for Windows and Linux. Build your own protocols top of IP and go to town!

> If I'm going to do a hardware project, it will involve a *lot*
> more RF power, and will use narrow band modes, like CW :-)

Heh. Suit yourself, I think 802.11b hardware is well within your grasp. ;-)

Well, Charles, I guess we're just failing to communicate. That's no
skin off my nose, most people seem to be able to figure out what I'm
writing even if you are unable or unwilling.

Actually, coming from you, that's kind of flattering.

Hi,

I'm planning to buy a starter 2m mobile. How good are Radio Shack 2m mobiles? I have two options
1. RadioShack HTX-212
2. Kenwood TM-201B
3. RadioShack HTX-242

I guess Kenwood has low RF output.

Thanks.

Chet

Sorry for the offbeat post.... it is kind of related!

Awhile back Motorola made a device called a Print Pal (p/n NYN1005A). This device was a cradle that connected a Motorola Advisor pager to a serial printer or a computer's serial port and provided us with a hard-copy output of an incoming page/reply.

The device is no longer available and the Paging Support group of Motorola says they don't make a replacement and know of nothing similar.

The application we are trying to solve... we page out a group of people and they reply back to this dispatch center pager (the one in the Print Pal craddle). The reply is a unique ID number (4 digits) followed by a * and then an ETA (4 digits in minutes) and then the # to send.

We want to track the replies, because if someone cannot make it, we would page their alternate, etc.

The solution we are looking for does not have to be using a Print Pal... but it would be nice to use a pager or some other device capable of receiving multiple replies in a very short time frame.

Any suggestions on other possible solutions or ideas sure would be appreciated.

Thanks in advance.

Terry - KA8SCP

I don't know which protocol this pager uses (pocsag? golay?) but what you could do is open one pager and often you will be able to find a line that carries the demodulated serial data (certainly in a pocsag pager - in a 4-level system things may be different).

You can connect this signal to a PC, and run one of the available pager decoding programs on it. When you have sourcecode of the program and some skill, you can do anything you like with the resulting data.

Printing, showing on a larger screen window, logging to disk, ...

Rob

>other encryption of our transmissions.

We can use stuff that protects the network from unauthorized users, but the FCC may have to be made aware of the method (so they can monitor it) - just like under the old SS rules where we had to give them the hop sequence if we weren't using the standard one. Preventing unauthorized access to a station is a licensee's responsibility.

ONLY encryption designed to OBSCURE the message is forbidden. Compression (which generally makes a message non-human readable) isn't encryption because its purpose is to make the message smaller, not to obscure its meaning, and is therefore legal. This means that PGP, SSL, and other such things are not legal (in the absence of giving the FCC the appropriate decryption keys, which partially [if not fully] defeats the purpose of encrypting).

Now, I'm not certain how much of WEP is actually for access and how much is for encryption within a private wireless lan - only because I have yet to actually mess with these devices first hand. It may come down to: "no problem, as long as the FCC has your wlan's WEP keys/info and transmitting location" (assuming that part 15 limits are exceeded).

Fry's does sell wireless lan equipment, but their employees are stupid. Radio Shack doesn't sell that (unless that's recently changed). HRO stays with radios, not computers, so they don't sell it either.

Yes. A mast-mounted pre-amp (and possibly a [mast-mounted] TX amp).

The 802.11b devices operate at a maximum speed of 11Mb (3-COM may have a 22Mb version on the market now, but no one else), with slower speeds of 5.5, 2, and 1Mb. Whether or not the fallback to the slower speeds is controllable or automatic I don't know, but it is there.

I thought that what you wanted was throughput? Narrowing the bandwidth narrows the maximum symbol rate and thus lowers throughput. Aren't you contradicting yourself now?

The RS radios you mentioned are discontinued, and I assume the Kenwood is, too. These RS radios aren't bad, but they tend to be a little pricey for what you get.

Keep in mind that both Icom and Kenwood have 50W mobiles with tons of features for $150 new, I assume Yaesau, Alinco etc. all do as well. So I wouldn't pay a lot for an HTX-212. If I recall, the 242 was a dual-bander, so it may be worth a little more. Still, I wouldn't give a lot for these.

But if you can pick up a 212 for say 50 or 60 bucks, maybe around twice that for a 242, and you are pretty confident it's in good shape, then I would go for it.

..

How much spreading (and hence processing gain at reception) do you get
with 11Mbit/s (or even 22 Mbit/s) compared to 1 Mbit/s, since the
available frequency band is quite narrow after all ?

With a standard WLAN card you quickly run out of the power budget
after a few reflections, but with a power amplifier, you could
tolerate more reflections before running out of receiver power. Is the
11 Mbit/s version robust enough in this situation with more
reflections and larger delays between reflections ?

"... stuff ..." does not seem to include data encryption.

> ONLY encryption designed to OBSCURE the message is forbidden. Compression

Isn't that the whole point of what the hardware does?
Or did I not understand what I read at the Agere web site?
It said "uses" and not "may use" or "capable of using".
Can one turn it off?

> (which generally makes a message non-human readable) isn't encryption because

Where is that in Part 97? Could not find any exceptions.

It's encryption. We can't do that.

The Agere cards come to $250 per end, not unreasonable.

So where do I buy that stuff I asked about?
Would rather use the 23 cm band (trees, remember?), is gear available?

How about some real help here instead of just speculation.
Model numbers, part numbers, connector information, device driver
and interface information, actual hard facts instead of "one might".

Maybe best to just forget this idea and go back to looking at
PacComm 56k and the Slovenian stuff. Appears to be something
real instead of some vapor-hardware-ideas.

Digital is only one thing I'm involved with. I also do a good deal of
HF DXing, and will probably get back into VHF/UHF Dxing.
For that I'll want 1500W on 2M and 70 cm to feed to large
yagi arrays. Might build those amplifiers. That's a hardware project.
Has nothing to do with digital though, so I don't babble about it
very much in this newsgroup.

But I guess you can't actually help out with the high speed links,
so I will look elsewhere. Perhaps some other hardware person
will have some more specific ideas, or I'll not bother with that
project and spend the money on 8877s and sockets instead.

Hi Terry,

As I remember the printing stand for the Advisor just supplied power to the unit, and maybe did a TTL to RS232 conversion. You should still be able to get serial data out of the contact pins on the bottom of the pager without the stand, and you may be able to just feed this directly to a PC serial port. The printing stand mostly provided an easy physical interface and it is not absolutely essential if you are willing to connect up to the pins directly and maybe use a homebrew TTL to RS232 interface, but again even that may not be necessary. The print option does need to be turned on in the pager with the proper programming software, though, or no data will be output from the pager.

Hi,

I'm ready to plunk down some coin on an awesome TNC. I was really close to buying an SCS PTC-II, but $1000 is just a little steep for me.

I am having a hard time deciding between the popular TNCs. I think the KAM XL looks like the best HF/VHF/UHF model around. At $380 it's cheaper than the KAM '98. Why is that? It seems like the XL does more.

Should I be considering the Timewave or MFJ products.

I know the standard question is: What do you want to do? Well I want to be *able* to do anything so I don't mind spending good money to get a good box.

Thanks for your advice! I really do appreciate it.

John

Guess it depends upon where you live.... Rat Shack sells wireless LAN equipment in south TX. So does Office Depot, Best Buy, Comp USA, Office Max. Dunno why anybody would have trouble finding it. It's hard to imagine S. Texas as being some kind of hotbed of wireless networking.

```

Have you looked into the sound card programs ?   It might take several
programs to do what the KAM will do but many of them are free.

This is better, by far, and the folks are quite happy to sell to American Hams. Ask for a price list and ordering info, they send it to you. Worth looking into.

http://www.symek.com/g/index-g.html   Symek High-Speed Data Radios

http://www.dutch.nl/bdj/index.htm   PE1JPD H/S 23cm data-tranciever

http://www.baycom.org/   Baycom High-Speed Modems, TNCs

The Baycom stuff is awesome. European Hams are now using it to upgrade backbone from 19.2 fulldup to 76.8 fulldup, allowing upgrade of user access from 9.6kb to 19.2kb.

Plug 'n play, reasonable prices, high quality equipment.

Charles,   N5PVL

The sound card programs are not generally competent to TX packet due
to timing problems under Windows..

Nothing at Rat Shack here. No computers at all.

Plenty of wireless networking gear available from any/all of
the above, but they dunno nothing about 1W amplifiers or
24 DBi antennas, nor how to deal with the hardware from DOS.

But those questions have all been answered for me now.
Nothing is available in a form of interest: pretty much plug
and play on the hardware side. So I'll do something else.

While 1200 bit/s is useful for APRS and DX clusters and also for
setting up ad hoc networks in emergency situations due to the great
availability of suitable unmodified radios and computers with sound
cards, but what is the appeal for 9k6 or 19k2 half duplex user access
ports ? These speeds are an overkill for APRS and similar
applications, but still too slow for most interactive applications.

We have seen this pattern in newsthreads many times. Hank challenges the others to come up with solutions for his particular problem. When people post hints about available products (e.g. by naming them), Hank asks for ready-cooked information and a dealer around the corner. He also often asks irrelevant questions (like: is it sponsored by ARRL).

When people point him to search engines, he just repeats the same questions in a followup. Usually third time.

And finally, while all others have read the information from the relevant websites, he acts as if it is not available, and blames the others for not serving it to his taste.

Hank, people have other things to do than cutting and pasting URLs from Google. Learn to type the keywords that people provide for you in a search engine, or otherwise keep your mouth shut. You are not an infant that needs to be spoon-fed, so why act like one every time?

Rob

Hi John,

The SCS PTC-IIe is $650 and has the same over-the-air performance of the Pro. If you are willing to spend $400-$500 then you should definitely spring for the extra dollars if you possibly can and go for the SCS unit. If you have any interest at all in HF data communications then the performance difference between Pactor I and Pactor II/III is night and day. The PTC-IIe can also do HF/VHF packet but if packet is your primary interest then the KAM implementation is much more fully featured then the SCS (i.e. has APRS features, etc.).

So, the standard 'what do you want to do' question really does apply... if your interest is primarily HF data then there is no question but to go for the SCS unit if you can. If you are really into the packet/APRS scene then you might want a more fully-featured packet TNC, but even then I would suggest getting the SCS unit and then just picking up an old $50 TNC off of the swap group for APRS. Just one opinion.

- Seth

Remember the criteria I use to judge the usefulness and relevance of packet
networking paradigm?

If it is being used by the folks who actually *build* significant amateur
packet raqdio network, and as would naturally follow, it is in fairly
widespread use, then I find it to be much more relevant than the stuff that
isn't.

The 802.11b stuff does not qualify, because it is only being used on a
small-scale basis by isolated hams, not on any significant scale by any
significant number of hams. This, despite the alleged low price, easy
availability, and the fact that hams have been discussing it for a couple of
years now. Your setup is typical of what is being done with 802.11... Not
significant if, in fact, it exists at all. I have my doubts about that.

It seems to be that you would be familiar with your own setup (if it really existed) and would so be able to give Hank the information he requested from personal experience. The fact that you cannot puts your "personal experience" into doubt. Makes it sound like vapor, the thing we get so much of from dweebs such as yourself.

I have no personal experience with the equipment listed above. (Well, I do have experience with Baycom, but not what I think of as "significant" experience!)

On the other hand, this equipment is seeing large-scale, significant use in Europe, where it has been proven to be high quality, reliable equipment. I found out about the reasonable prices by following the directions at the web sites associated with them, and recieving a price list.

You would have to take off your amateur tcpip blinders off to see the significance in what most other hams do, Paul. There's a big old world out there, and you are looking at it through a keyhole. It's no wonder that the motivations of the great majority of hams is a mystery to you.

The SCS PTC-IIe , in conjunction with a BuxCom "Rascal" interface for soundcard use, will give you the best combination of high performance and choice of operating modes.

I will admit though, that doing so would put you over budget.

If you have no prospect of obtaining any more cash and 500 bucks is as high as you can go, the Timewave PK-232 is a better bet than the KAM.

This is just a personal opinion. Your mileage may vary.

I just wanted to know about your personal experience with this
equipment you're recommending, could you please relate that?

> If it is being used by the folks who actually *build* significant amateur
> packet raqdio network, and as would naturally follow, it is in fairly

Well, sure, but what's your *personal* experience with this equipment that you highly recommend?

> Your setup is typical of what is being done with 802.11... Not significant if, in fact, it exists at all. I have my doubts about that.

Are you calling me a liar? I've shared the details of an 802.11 setup that I've personally worked on, and you're calling me a liar! So far, you've avoided sharing your personal experience with equipment you highly recommend, instead beginning to speak in generalities and then launching into your requisite personal attacks.

Just answer the question, Charles, without trying to deflect the attention - what of that hardware you highly recommend have you personally used? Just a bullet list would be a good start.

> It seems to be that you would be familiar with your own setup (if it really existed) and would so be able to give Hank the information he requested from personal experience. The fact that you cannot puts your "personal experience" into doubt. Makes it sound like vapor, the thing we get so much of from dweebs such as yourself.

I *have* given Hank, and everyone else on this newsgroup, that experience. Just click on this Google link, though I suspect the artcle is still on your news server, since it was only posted two days ago.

http://groups.google.com/groups?selm=3D76B0CF.4040507%40dioxine.com&oe=UTF-8&output=gplain

This article answered Hank's question on 'how to get started'.

The link I use is constructed mainly of two Lucent cards, pigtails, a few dozen feet of LMR400 and the associated N-connectors, two of the YDI 500mW bi-amps and associated DC-injectors, and two of the PT2424 antennas on solid mounts (they don't tolerate much shakin' around).

It's real. Come on out to California and see it. I'll grill up some dinner and open some good wine and you can apologize to my face.

> I have no personal experience with the equipment listed above. (Well, I do have experience with Baycom, but not what I think of as "significant" experience!)

Ah. What exactly are you basing your glowing recommendations on?

> On the other hand, this equipment is seeing large-scale, significant use in Europe, where it has been proven to be high quality, reliable equipment. I found out about the reasonable prices by following the directions at the web sites associated with them, and recieving a price list.

Now I understand.

Which "interactive applications" did you have in mind?
9600 seems to work fine for things like web browsing and telnet..

One does ftp of large files or large groups of files in batch mode
of course, just as one would do on the internet.

Same problem, looking for the same solution, hope that it is
now available. It's not available. Yes, I am looking for "ready
cooked" solutions. That was the entire thrust of my initial question.

I got the answer: no such solution exists yet. Thank you all.
Will ask again in 6 or 9 months. Maybe then such a solution
will exist, and I will consider purchasing it.

The same folks continue to answer my query about "ready
cooked" solutions by telling me I can design my own. I know
that, and I know how, but that was not my question.

So who or what DOES sponser OpenAP?

Hi Terry,

Maybe a MAKInterface kan help you?

http://www.makinterface.net/index_e.php3

You can also try tnn.comm.pager instead of
this newsgroup.

Bye, Peter Hunt PE1RFR.

A ready-cooked SOLUTION is something else than ready-cooked INFORMATION
Hank! I refuse to do the searching for you in a world where searching for
information (about topics like this) is as easy as typing the word and
clicking on a button.

You miss all kinds of solutions (ready-cooked solutions) by being so
stubborn in the way you want the information presented to you.

Rob

I've looked at everything anyone has posted.
Charles posted useful links, but is the same stuff as last time
I asked the question.

Yes, I've been to the OpenAP web page.
Nothing useful there.

It seems hard for folks to understand my question.
Don't know how to make it more simple.
I am looking for plug and play solutions.

They are not for *me* to use, I can design and build my own
if I wish to do that. They are for some hams who want to build a
network. They do not want to create their own capacitors and resistors,
nor build computers from parts, or assemble things from kits. Sure they
could do that, but that was not the question they asked. They want
to plug together modems, radios, etc. and make a network. They need
30 - 40 links, and they have money to buy things. What they have
bought so far is a few KPC-9612 TNCs, TEKK radios, M2 antennas,

thrift shop computers, 9913 coax, Astron power supplies. They
have the first test links working at 9600 and 1200 baud. 56k or
faster would be desirable. The question they asked me was "Can we
buy something different than the above list of gear and get faster links."

I gave them pointers to PacComm and Symek long ago,
since those are known working plug and play solutions.
They may buy some of that gear for test links.

So I asked here about T1 data rate.
Got the answer after much pushing and shoving: nothing is available.

"One might" or "One could" is not an interesting answer.
"I built one link" is not an interesting answer.

"We did" along with "We used this gear" and "We have 10
links working in a network" would be an interesting answer.

If it would be useful, then it won't be available on Ham radio.

Get a cell phone, or Ku band satellite radio.

Ham Radio is for morse code, and not for being useful.

They work fine. Our wireless WAN remained operational, on
emergency power, for the 3 weeks that we lost commercial power
and cooling after the largest tornado in Oklahoma history wiped out
all the homes between our two link nodes (500 mW, 21 db gain
antenna's). It has both data and VOIP channels.

Hank has a point... You can google back over this newsgroup's last decade or so of postings and find dozens, perhaps HUNDREDS that sound almost identical to yours. So far, I have not heard of a single case where the poster went on to build and demonstrate anything tangible. They all have great ideas, and are all outaged that somebody else does not act upon them.

Yes, I feel the same way... If somebody else would act upon all my great ideas, most of our problems would have been straightened out by now. You bet!

Most of the posts like yours come from other students, learning all about Linux and tcpip. All of that high-speed stuff appears so EASY to aquire, set up, and run to them. It's a snap! - But you don't hear about any of them actually building network. Maybe a demo system with two or three users, but no network. Obviously, you and your fellow students are overlooking something very basic. Something fundamental is whizzing right over your heads.

Ten years of the same kind of posts, parroted verbatum ad nauseum. - Ten years of zero results. Obviously, there's a hole or two in the paradigm.

To see what the the folks who DO build network have been up to:
http://www.uspacket.net

Some of it is high-speed, a lot of it has IP running over it, but none of it is as you describe. You should ask yourself "why", eschewing the sour grapes and approaching the question critically. Try thinking independently, outside the box of the flawed paradigm you have been led to base all of your expectations upon.

Let us know what you discover.

Charles, "Show me your network" N5PVL

Has anyone in the group had any experience using the built-in TNC in a Kenwood TS-2000? I already know that it is limited in capabilities but, what have YOU personally been able to do with it?

I came across an old terminal and was wondering if there is any info on
getting it on packet? I think they were used as packet terminals at one time
but not sure.I'm having trouble getting it running,the small toggle switches
are out of whack and need some guidance.
Thanks all

Ah yes, the old Hazeltine 1510. I have three or four at my house, and the manuals for them. Here's the necessary settings for the DIP switches just to get you going.

Three banks of switches, from left to right, D means set towards the keyboard, U means towards the CRT.

Left bank: U U U U U U D U sets the speed to 9600 baud. Only one switch can be down at a time. Towards the left are lower baud rates; the right-most switch is 19,200 baud.
Middle bank: U U U D U U D D sets the unit for standard full-duplex RS-232 and no translations.
Right bank: U U U D U U U U sets ESCAPE as the lead-in character; set them

all U for TILDE as the lead-in character.

The terminal normally comes up in DIM or background mode. To get it to be bright, you need to program it with a specific sequence of characters that depends on the lead-in character you've selected. There's not much else special about the unit except the video electronics mounted to the top of the cabinet tends to get quite hot.

I usually jumper the male DB-25 connector pins 4+5, 6+8+20. The terminal transmits data on pin 2, receives data on pin 3, signal ground is pin 7, chassis ground is pin 1.

If you need more info, I could make copies of necessary pages from the operator's manual. I bought one new in 1978 for $850, and that was cheap back then. Any more questions, please don't hesitate to ask. Good luck with it.

Bob M. WA1MIK

I sent a similar message a week ago and didn't get any responses from
regular users. Has anyone used this tnc and software combination to work
psk? This is the software that MFJ claims works with their tnc and enables
PSK, SSTV modes, etc. It uses a combination of serial and soundcard
interface. I have continuous lockup and resource problems on multiple
computers/platforms and OS'. I want to hear from other users if they exist.
Do you experience similar problems?

Thanks in advance,

Loy

Ahh...  the famous Hazeltine ~ braindamage :-)
At least on this model it can be avoided...

Hi All,

I have a number of Xilinx XCS20XL FPGAs in the 100 pin QFP package.
These FPGAs are 3.3V. If anybody would like to use them for Amateur
Radio purposes, modem, repeater control etc. let me know and we can
sort something out. (The XCS20 5V is used in the Baycom EPPFLEX & USB
modems)

Regards
```

I've been using an old Casio A-10 HPC running Windows CE for years. I think I was one of the earlier people to get on here & discuss this. Your device whether it's a Palm or CE device are basically the same. You need a decent communications program on it to hand-shake with the TNC. Your main job is to fiddle with the parameters of the progam to get it to "talk" to the TNC properly & to your liking. The "Terminal" program in Windows devices works well. There is also PalmAPRS, APRS-CE, PakRattCE, probably others to my knowledge. A main hardware task other than getting the proper adapters to connect to each other is that a PDA is considered a device, not a terminal. Simply, you must use a null modem to have your device (PDA) to "talk" to your other device (TNC). Once you get this running, you see your TNC handshake with your PDA like your TNC's CMOS info scroll across your screen, you are nearly ready to talk. What's that? You can't see what you're typing. Type in "echo on". Now you should be able to see what you're typing. I use a Casio A-10 4MB Windows CE 2.2 HPC, Paccomm PicoPacket, & Alinco DJ-190T HT. It all fits nicely in one of the Radio Shack radio fanny packs. Don't be afraid to experiment.

Boy, that's a bit of history there! What you have there is a dumb terminal. It doesn't have any packet capabilities without a Terminal Node Controller (TNC). If you do not have the manual for one, you might be able to find some data on it by reverse compiling the termcap files on most unix or linux style operating systems.

Many of us used to adjust the prompts from the TNC gear we were using to make the display a bit prettier, but that's about all I remember of the Hazeltine. My brother used to own a Hazeltine 1400. So I do remember something about it, although it was around 25 years ago...

If I were you, I'd try to find something a bit more recent to use for packet work.

Hi,
about a year ago (in the summer of 2001) there was an article in QST
with a x-tal controlled transceiver specialy intented for PSK31.
May be this information can help you because may be someone can
provide you a copy.
Good luck,
Chris PA3CRX

I used one for packet years ago. All you need is a TNC, and the teminal will
display well, but you can't save anything to memory, but you can print it

out with you printer.
Perhaps a KAM would work nicely.

Hans,

Take a look at:
http://www.geocaching.com/seek/cache_details.asp?ID=16679 and
http://www.kg4cnm.com/geocaching.htm for what KG4CNM is doing with the
combination.

there may still be some 10FM activity, that uses the same tones/shift as
V/UHF to be honest, I haven't heard any for ages, but then I haven't
listened ! Try listening around 29.250FM for Northern Europe. ISTR that
there were some OH's around there.

Yes, it's the March 2001 issue of QST, on page 37, "The Warbler --
A Simple PSK31 Transceiver for 80 Meters", by Dave Benson and
George Heron. I dug up the article when I first saw this thread,
then just didn't get around to posting.

It certainly is simple, trading duplication (they use separate
crystal filters for both transmit and receive) for simplicity
no fussing with a lot of switching between RX and TX).
It a direct conversion transceiver, with the crystal filters
right on the operating system; in this case they use 3.58MHz
subcarrier crystals for the ladder filters.

Greetings All:

I would like to do the memory expansion upgrade to a KPC-4 version 5.1 but I am unable to obtain the technical details from Kantronics as this TNC is discontinued. However Kantronics did advise that all I need to do is get the proper components from DigiKey and complete the installation.

I wonder if anyone here has the details on what is involved to expand the memory? I suspect it is just a matter of obtaining the appropriate 32K RAM chip and installing it in the place of the existing 16K? chip. Can anyone here confirm this and advise of the number for the chip I need?

Also as a lessor priority I would like to install the battery backup and/or SmartWatch options. Any information on these options would also be helpful.

Many thanks in advance for any replies!

73 & Enjoy!
Tom, VA7TA

A friend just bought an Alinco DR135TP and is having problems
getting the computer to talk to it. He can't get any response on
the computer from the TNC, either in a couple of packet programs,
nor in Telnet. He says that the ports are set correctly.

He took it to the dealer the other day, and after some futzing
around, they were able to get it to work.

Does anybody have a suggestion for me before I go? Common
problems? Useful FAQs?

Thanks in advance,
--

<snip>

The most common problems I've seen in ANY serial-port type communications situation are:

--Cable not wired correctly (this is a big one. Check that cable! RTFM! Use a breakout box!)

--Comm parameters on one port do not match the other.

--Bad RS232 line driver/receiver chip at one end or the other (used to be easy to replace. Not so with a lot of stuff today. Use an O-scope or a good logic probe to troubleshoot).

Good hunting.

Thank you to all jenuine enquires. Now the IC746, Yaesu FT707 ES Matching Pwr Supply ES Speaker FP707 and Graphic EQ have all now been sold. The below goods are still for sale.

****Garmin GPS 12XP MAPPER****

GPS Garmin 12XP has latest software on-board (Latest software upgrades available on-line from Garmin) 12 SAT channels. Includes Full manual and quick guide chart, soft carry case and External Sat Antenna along with Data and Power Leads. Comes with 9 months guarantee I want �150 no offers please.

Buyer collects or Courier...

****OPTOELECTRONICS DIGITAL SUPERSCOUT****

OptoElectronics Digital SuperScout. See the latest information about this wonderful snooper.... Covert.... Intelligence RF scanner. It is compatible along with almost all the latest scanning equipment. Just plug and play for hi-speed (Lightning fast) freq. QSYs. Also use it alone for building up a data-base or Freq. list for listening in conjunction with other type Radio RX type equipment or simply use it for Bug Scanning ETC. My Price immaculate condition along with charger and NmIh Battery pack full instruction manual. My asking price Is �200 no offers.

Buyer collects or Courier...

****DANMike Digital DSP Scramblers****

DanMike Digital DSP Scramblers x2. Suitable for all types of TX-RX equipment. Just configure them to your equipment's microphone wiring schematic. These are very secure offering thousands of different sequential combinations for Digital DSP encryption (Have been tested into Dummy Load and configured for IC746 & FT847). Come complete in boxes including manuals and pre-wired for the above radio equipment. My asking price is �100 no offers.

Buyer collects or Courier...

*****************CABLE*******************CABLE***********************

For Sale I have x7 250 Mtr Drums of VR304 7/8ths 50Ohm Vy Low Loss Cable. This cable runs rings round (Andrews Heliax)7/8ths and is some what more flexible. It is used for SHF frequencies on all mobile cellular mast instalations. Comes with a Solid outer shield then x2 Foil outers and then a very heavy Silvered Braid. The centre core is Air Spaced in a poly Air cell dialectric. Losses per 250 Mtr drum @ 13cm are typicaly 3.2dB...

Anyone interested in this type of Cable for the Hobby please mail me. This

cabel can be used for all bands including HF when extremely long runs are
required. Only serious enquires please. You pay for the transportation of
this Cable. 1 Drum weighs approx 75Kg I am asking a moderate �150 for each
drum. If you are a 70cm and up man/women and do not want loss this is the
cable for you!

I'm using mscan and have problems with pci sound blasters. A 16 bit SB works fine but when I try a newer SB I have a problem with calibration. Incoming calibration works fine. But when I calibrate the outgoing signal it works ok until I close the program. When I restart the program incoming calibration is ok but I do have to calibrate the outgoing signal every time I run the program. Whith te 16 bit SB its not nessesary to calibrate the outgoing signal.
I'm running win 200 pro on a AMD K6 400 MHz

It's not that simple. Wire has near perfect propagation and all receivers can hear all senders. This is a requirement for "collision detection and retry" that is used in wire. If hams will take the challenge there is room to innovate wireless protocols.

Yes, I think TCP/IP is the way to go simply because it supports so much, but the details of the underlying protocol (in case of wire, Ethernet) needs to be worked out for cheap and effective wireless.

The problem seems to be that those interested in packet radio or other high speed digital communication, but they are not interested in radio wave propagation or radio design.

It appears that most attempts to use higher data rates have been based on more or less scaling up existing low speed VHF systems, i.e. increasing the baud rate on a single FSK/PSK carrier and trying to keep the bandwidth as narrow and using simple CRC for retransmission control.

While this is a quite adequate approach for line of sight space to ground communication (except for the too small window size if AX.25 is used :-), this approach is practically useless for terrestrial communication, since it very badly deals with terrestrial propagation conditions. Thus, in order to get these systems to work, nearly LOS paths must be used (with the difficulty of finding suitable sites) and in order to maintain the high average SNR required to at least handle some mild fades, a high transmitter power is required (which is costly) or the maximum link distance must be reduced.

On the commercial side, any successful terrestrial digital system will address the multipath problem by suitable modulation methods (COFDM, spread spectrum etc.) and code interleaving and also recognise the high cost of retransmission (by using FEC).

Until these factors are recognised by the ham community, packet radio will remain a low speed activity, only really suitable for applications like APRS and DX cluster (DX-spots and talk messages).

Perhaps it's a complete lack of knowledge in what makes up the cable and the belief that some operators would be willing to explain a little to me. Amazingly, I have gotten some actually USEFUL replies to my post.

You assume too much. Specifically, you assume that I was trying to insult you. Such is not the case. I was merely concerned, should I choose to pick up a similar radio, that such a cable might have some sort of molded-in electronics in it, making it difficult to reproduce.

Perhaps your energies would have been better used in SHARING some of those "useful replies" you have received instead of choosing to get all huffy about a simple question.

Some of us are mostly interested in the software issues, others may be
interested in hardware, and yet others in RF design, antenna issues, etc.

My code, and perhaps a few other codes support the PE1CHL
large window modification. Solves the problem.

Exactly.

Some of us software types would very much like to implement some of
the interesting things one could do over a fast network. The hardware
types have not yet provided any viable hardware :-) I suspect there is
a reason for this. Perhaps it is difficult and expensive to do so, and
the perceived market is too small.

I'd sure like to run T1 rate across 30 - 100 km. obstructed paths.
But I won't pay US$5000+ to do so.

No, but some of us find that as we have aged, the fine motor
control required to solder small wires to small connectors
(e.g. small audio plugs, mini-DIN) has gone away, and we
either need help constructing cables, or we buy them.
Kenwood's use of RJ-45 is great! I can still crimp those.

Check the MFJ web site, they may have such cables.

(All cost figures are in US dollars, and US CFR 47 is assumed)

Well, I've seen better than T1-rate across a 20km obstructed path using 802.11b hardware. Summary of cost - two Lucent cards ($150), two power amplifiers ($1000), two antennas and misc hardware ($300), and sundry coax and so on ($100). That's under $1600 for a reliable 11mb/s link built using off-the-shelf components in a couple of days. You can buy up to 10dB more link margin by limiting the speed to 1mb/s if the Ethernet-speed makes you uncomfortable.

All legal (though right at the EIRP permitted by the 3-for-1 antenna gain rule in Part 15 for 2.4GHz). To be totally fair, the 20km path I'm thinking of is generally clear with a serious obstruction (i.e., a hill with houses on it) about 1.5 km from one end.

The same basic configuration could easily do 30+ km, but you'll have to be more specific what you mean by 'obstruction'.

I'm not sure one could even come close to this performance/cost ratio using amateur gear, and I'm fairly certain the absolute cost would not be lower. Note that 5.8GHz has no EIRP limit, only a transmitter-power limit, which encourages the use of higher-gain antennas, and promises to achieve better performance/cost in the near future as we start to see commodity hardware.

If software is what turns you on, then Part 15 hardware is almost certainly the path of least resistance.

If I understand that you're saying, it sounds like we have a "chicken
and egg" problem. No one will develop the hardware until there is
viable software and the software guys have nothing to work with until
someone does the hardware. Keep asking around. I think you have to
find a hardware guy to work with directly.

And the vast majority is only interested in $10 "solutions" that can be
attached to existing voice transceivers.

KA9Q has published some demo code for better modulation methods.
This code should also be viable at higher rates, but the de-facto standard
soundcard may be a limitation.  A viable hardware system should probably
consist of a transceiver with I/Q modulators and AD/DA converters that
support higher sample rates and attach to the system using a widely
available fast digital interface.  Probably USB is the only viable one.
(parallel port is too limited as most systems have only one and want to
use it for the printer; ethernet is good but difficult to integrate
without lots of fast intelligent hardware)

The DSP stuff can then run on the PC, in which amateurs normally invest
a lot of money.  Designing a DSP system that can be built by the average
ham, at a price he wants to spend on a blackbox, and can be programmed
by more than a happy few, has proven to be unrealistic.

This will not happen until some commercially available systems are used directly or modified for a suitable ham band.

>I'd sure like to run T1 rate across 30 - 100 km. obstructed paths.
>But I won't pay US$5000+ to do so.

Running T1 rates across 100 km is quite hard as this back of the envelope calculation shows.

At those speeds the first band with sufficient space is the 1.3 GHz band and at that distance the only practical propagation mode is troposcatter. The path loss is less than 200 dB for 99 % of the time (source: RSGB VHF/UHF manual and some old ARRL VHF manuals).

The required (despread) bandwidth with error correction bits is about 2 MHz, so the thermal noise in that bandwidth is about -110 dBm. Assuming that 10 dB SNR is required, the required receiver power would

be -100 dBm (which might be a bit optimistic, when comparing to
sensitivity figures for 11 Mbit/s WLAN cards).

Assuming 20dB antenna gain at both ends, the required transmitter
power is -100 dBm - 20 dB + 200dB - 20 dB= +60 dBm or 1 kW.

Not very practical, especially if the sensitivity figure is too
optimistic. 99 % reliability may be a bit too low for backbone
networking, especially if multiple extended hops are in the chain.
99.9 % would more appropriate, but this would require 10dB more into
the link budget in terms of transmitter power or antenna gain.

Clearly such long backbone hops are out of the question even with
optimal modulation.

Also consider that at 100km (about 62 miles), the curvature of the Earth also
becomes a factor, except perhaps for mountain-to-mountain.

Not really an issue, unless there are very high (several km) high mountains in the path _between_ the stations.

My calculations were based on troposcatter, in which the signal is scattered from an air volume somewhere halfway between the two stations. The scattering air volume is 100-6000 m from the ground (depending of the distance between the stations) and visible to both stations.

Look at any VHF/UHF contest results, there are a lot of contacts in the 200 - 500 km range no matter when the contest occurred. Most of these contacts are made through troposcatter, which is quite reliable day to day propagation mode.

Previously the only telephone contact to North Sea oil rigs from Scotland was through troposcatter links.

Running high speed data over troposcatter links will require some advanced modulation or coding method to avoid the problems due flutter, which is often quite common in troposcatter links.

Nobody closer than 30 km for the other end.
It's not Ham Radio.

One 11,400 foot mountain :-)
That particular path has the glacier on the north slope of Mt. Hood
almost exactly at mid path, path is about 200 miles. and works
very well with 10 dbd antennas and 50W at 1200 baud on 2M.
However there is no longer any interest on the other end.

But back to the existing situation.

The paths in question have obstructions into the line of sight
anywhere from "a few feet at one point" i.e. grazing, to "500 to
1000 feet at several points". The grazing paths work well at
9600 baud, the other paths do not, but support 1200 baud.
There is some forest in the way at most sites. It can't be moved.
There will be some foliage loss involved, thus more power needed.
This also suggests using lower frequencies, e.g. 70 cm.

> I'm not sure one could even come close to this performance/cost

I was indeed talking Ham Radio gear.

Thus the posting in this newsgroup.

> If software is what turns you on, then Part 15 hardware is
> almost certainly the path of least resistance.

What does that have to do with Ham Radio?
If I want to write software not involving Ham Radio, I'll do some
consulting and make money. The whole point is Ham Radio.

I could care less about the non-ham stuff. I am an amateur radio operator, not a CB'er or "amateur communicator", so the non-ham stuff has no relevance to my interest, amateur radio. In this, I am in the company of the great majority of U.S. ham radio operators.

I have seen so many discussions of this or that high-speed setup here, without seeing any of it realized, that I now consider most of that discussion to be utterly pointless. There are a number of high-speed solutions around, that have been around for some time now... I haven't seen significant use of any of them in the U.S..

If it is not used, it is not useful.

Since backbone links need to be significantly faster than user access, I can see a real use for high-speed packet there. High-speed user access is not high on my priority list, though.

When you get past the pointless discussion go-round and look at what hams are actually building, you find 1.2kb or 9.6kb user access, and 9.6kb or 19.2kb backbone links. (In the U.S.) There are a few exceptions, but none that have produced or resulted in significant network. Those that do tend to be self-isolated, out of touch with other networks and what the majority of hams are interested in.

The folks who are hung up on high-speed, "IP only", and non-ham stuff are definately out of touch with the realities of amateur radio, and most importantly, with their fellow amateur radio operators. Most hams could care less about these, and "most hams" is the group we should be concentrating our interest upon.

Looking at successful, growing packet networks in the U.S. today, what I generally find are 1.2kb access, with 9.6kb backbone. (with some higher speed backbone, here and there.) This represents at least 80, maybe 90% of what is actually being built and used, as opposed to just being talked about.

Amateur tcpip enthusiasts are kind of jingo-prone... One of their catch-phrases that you don't hear about much anymore is the "critical mass" that was supposed to be achieved, where every ham in the U.S. would suddenly decide that amateur tcpip is the only way to go. TAPR has made repeated attempts to cram amateur tcpip down amateurs' throats for years now, to no avail. They are totally out of touch with what U.S. hams actually want, and are willing to work with.

Amateur tcpip IS a good way to go. Anybody can see where it can simplify things quite a bit for some kind of emergency communications, where non-hams need to be able to use info moved over a packet radio network. On the other hand, the fact still remains that most hams are not very excited about it, and for the great bulk of emergency communications, it is not really neccessary. The largest, most effective packet radio emergency net on the planet (SEDAN) uses regular old X1J nodes with 1.2kb access and 9.6kb backbone. They do not bother with tcpip, because they have not found it to be neccessary or even particularly useful.

I think the main reason that amateur tcpip doesn't fly is that what you end up with is a third-rate, extra slow Internet clone. Who could get excited about that?

When you run regular tcpip applications over the actual kind of network that is being built and utilized, it's pretty dissappointing. Who could get excited about slower than dialup tcpip, when broadband is now so cheap and easy to get in most places? When you run tcpip over amateur packet radio network, it doesn't really "shine", and as we all know, the high-speed stuff is no more popular than amateur tcpip. Both go together, both are not very interesting to most hams.

There is certainly nothing wrong with discussing high-speed, or amateur tcpip. On the other hand, way too little attention here is being given to *building network*, and addressing the needs and desires of any but a tiny minority within the ham community.

Charles, N5PVL

Agree.

I think high speed directly between users, medium speed for the longer local hops (my 30-100 km links) and low speed for long haul hops is a better idea. i.e. it is possible to build.

Note that when I say "user", that user is running a router/server box. There is no difference between one router and another other than intended use. Everything runs tcp/ip and NET/ROM over AX.25. Most of the applications are tcp/ip now, but we support the old apps as well for those who wish them.

We are not building client/server network anymore, but building peer-to-peer network. Of course we supply those client/server capabilities for those who still run ASR-33s, C64s, or CP/M machines ;-)

Network is growing again, although slowly. Two new users (nodes) last weekend, both at excellent link sites, both with 9600 and 1200 ports. One will have 3 radios eventually, the other will have 4. Both will help link into fairly remote areas where users now have no access at all. Two more should appear within a few weeks. They have computers, tncs, radio, sites, but are not yet on air.

Our fastest links are 19.2 k ... and that's still too slow.

I think that I hear the "Not Invented Here" syndrome.

Is it so hard to admit that the industry has solved the problem of sending high speed data over short distance obstructed paths with low power ?

Unmodified commercial systems are fine for testing various concepts e.g. in networking and if works, expand it to higher power and other frequencies. Hams are allowed to build new and modify existing devices. Why not take a commercially available system and modify it for an other band or run the signal through a transverter and use a power amplifier and highly directional antennas. One thing could be to run a 2.45 GHz WLAN card into a 2.45/1.25 GHz transverter and then run the signal through a 23 cm ATV repeater.

If your FCC is still as restrictive to allowed modulation methods on ham bands as before, I think your national ham radio organisation (ARRL) is not doing its job and it should really start some serious discussions with the FCC about removing these restrictions. But I guess that the ARRL is most interested in developing methods that people can use for generating and collecting QSL cards :-).

Hams can be users of Part 15 equipment, Hank.

If the Part 15 gear gives you a platform to further amateur
radio experimentation, why not?  If it's truly a chicken-egg
case with hardware vs. software, this is perhaps one way to
break it.

> If I want to write software not involving Ham Radio, I'll do some
> consulting and make money. The whole point is Ham Radio.

You're drawing a harsh distinction.  If by "ham radio", you mean
```

only things which are exclusively permitted under Part 97, that's one thing. If you think of ham radio as the non-commercial radio service with goals set forth in 97.1, then Part 15 may be a means to an end.

If it makes you feel better, use the Part 15 equipment in excess of the Part 15 regulations and figure out how to properly identify it. Just make sure to limit operation to the channels permitted under Part 97, then use as much power and antenna gain as permitted under Part 97. If this causes the Part 15 users any heartburn, you can smile warmly knowing they're not protected from interference from licensed radio services.

Then you're operating under Part 97 and it's undeniably Ham Radio even under your apparently harsh definition.

A couple of other thoughts:

The encoding on WWVB is a bit more straight forward than WWV.

Building a WWVB receiver would be a fun project in itself, or you can
get WWVB synched clocks these days for about $30 and tap into
it and have a wall clock and a computer syncer.

To have a good reference clock, you need to find the exact time of the second-pulses of the clock relative to the system clock. Different tricks, with different accuracy, are used in the example clocks. Generally, the more accurate it is, the more system-specific it tends to be.

Simple methods like feeding the signal to an RS232 port RXD line on a serial port set to 50 baud serve well to discriminate between 100ms and 200ms pulses, but the exact timing is muddled by the scheduler that delays the running of the xntpd process for some time after the character came in.

Better is to have a dedicated serial driver that e.g. handles a DCD interrupt, with the pulses connected to the DCD line, and reads the microsecond or nanosecond clock (which is available in i386 Linux) inside the interrupt handler, and builds a queue of timestamps for the application to read. I once had something like this running on my machine, and used it to do the measurements I mentioned before. I stored RMS values for 1 minute of data, and plotted these for about two years. Very interesting.

However, I lost interest in it and got tired of patching the kernel every time, so now I use the standard user-mode xntpd with a serial port. This of course gives a 10ms jitter for every measured seconds pulse, which averages out to a noticable error that you see in the xntpq (peers) output.

I have a GPS receiver online as well, but only on the serial data line.
So no really usable time comparisons.
Got to connect the PPS sometime, and then compare DCF77 and GPS. I am soon going to upgrade the system, that is a good time to really connect this GPS receiver which now dangles on a couple of flying wires.

Agreed. I've certainly learned some from your post. The timestamped DCD queue idea is elegantly minimalist

Since the base poster mentioned soundcards, I presumed we were in the domain of radio-to-audio-encoder solutions only. That's why I mentioned the NTP/WWV refclock; it uses /dev/audio as its point of ingress.

Hank,

I agree with the above statement 100%.

The inertia exhibited by the average ham
works against any improvement in the
process of doing anything new.

Some of the OT's would rather die than
give up their old, cherished ways of passing
traffic.

Moving into the digital age would mean that
they would actually have to invest time and...
dare I say it!?! MONEY!

Oh, well... Back to tilting at windmills.

I don't mean to be equivocal, but the topic is really too complex to lend itself to a simple answer as
throughput will vary dramatically based on many factors. Roughly, Pactor II will be several times faster
than Pactor I, and my on-air experiences with Pactor III indicate a similar improvement over Pactor II.
There is a lot of information available on the SCS web site (www.scs-ptc.com), or if you don't like
trusting a manufacturer for information there are endless generic info sites such as AC6V
(http://www.ac6v.com/opmodes.htm#D - click on 'Digital' at the top of the page), plus much more... just
do a search and you will get all the data you can stand. Best for you to read and judge for yourself
because if I give an answer on the newsgroup I will probably receive many friendly flames based on my
estimates, and they would probably be well deserved. Do some research and you will get the picture very
quickly.

- Seth

Oh oh ... I'm in deep doo doo ... licensed 49 years ago, so guess I'm an old timer ... but would rather do traffic digital than voice or CW.

The simple answer: PACTOR I will give you something around 100 bps to 200 bps as an absolute max. PACTOR III *may* give you as much as 1500 bps. The above depends on a dozen or so different things, including obtainable data compression ratios, path quality, interference, S/N, et al.

The simple answer is "LOTS MORE".

Just to bring things back on track a bit.
A couple ideas once you get the time code decoder working.
Decoding the time code lets you know what time it was when the time code was sent, but ...

Track the time of arrival of the second ticks,
keep running mean and mean deviation.
Track the time between tick arrival vs. system clock.
You now have a view of the change in path length from you to Boulder, Colorado. (Making some assumptions about system clock jitter of course, that it is small in 1 second.)
That gives you the height of the reflecting layer in the ionosphere.
You can track this. Mean and mean deviation.
Over long periods of time, the mean will approach the theoretical path length, which you can calculate using geometry.

Keep track of all of the above, and you can synch rather near to the actual time, almost all the time.

Of course this is not a new idea, was done many years ago.

LORAN stations still in operation or are they all off air?
Used to be another good source of time.

TV signals are another good time source.
The interesting experiment would involve several channels, in different directions from your QTH, with path delay estimation similar to the HF case.

[snip]

But... but... I guess your not an old enough "old timer" Hank.

CW is digital!

All of modern electrical communications technology started out as digital
[Morse] then later it went over to the "dark side" for decades as bad old
analog technology with the advent of the telephone [Bell] and now is once
again returning to digital [Shannon].

TV stations aren't a particularly good time and frequency reference.
The regulations say that we must keep color burst within +/- 10 Hz
and carrier frequency within +/- 1 kHz of their assigned frequencies.
We don't make much effort to stay within less than half of those
tolerances. The station references are typically ordinary crystal
oscillators in simple crystal ovens.

TV waveform timing is critical from source to source, a few nanosecond error can introduce artifacts when doing effects. But we handle that by locking all the sources to a common station reference (or just reclocking everything at the input to a digital effects box). It is the stability and accuracy of that station reference I'm talking about above. That's what you'll see receiving an off air signal.

Note, many years ago, the networks used rubidium standards, and many local stations did too. By adjusting out the Long Lines microwave path difference, we could switch directly back and forth from local to network without any timing artifacts. The coming of satellite distribution of network signals put an end to that. GEO sats aren't really stationary. They wander around in a box in the sky. This introduces a doppler on the signal of a few Hz (and the networks switch uplink origination points several times during the day). So it was no longer practical to keep the network and local reference in coincidence.

Fortunately at about this time the digital frame synchronizer became cheap enough that we could put one on every out of house source. A frame sync digitizes and reclocks the external signal so that it comes into synchronization with the local station reference. Even if the external signal's timing were rubidium clock based, that is lost after the signal goes through the frame sync.

Because of the near universal use of frame syncs, the networks replaced their rubidium standards with ordinary crystal oscillators when their rubidium standards broke down. The local stations who had maintained rubidium standards did the same. So now the best you're going to get from off the air TV is ovenized crystal oscillator stability and accuracy, no better than you can easily generate at home.

Gary

You can do high accuracy and high resolution timing with much less overhead, if you forget the concept of minutes, seconds etc. in the interrupt service routine. On a Pentium, simply read and save the 64 bit Time Stamp Counter (TSC running at the CPU clock frequency) in the clock pulse interrupt service routine. On other platforms any readable high frequency counter with sufficient bits will do. With a very low interrupt overhead, quite high interrupt rate can be used.

All other processing (such as averaging and conversion to minutes and seconds if needed) can be done in the non-interrupt context. The CPU clock frequency drifts with temperature and there can be all kinds of jitter. With a 1 PPS interrupt, the difference in TSC counts is directly the CPU frequency and after averaging to remove interrupt and clock jitter the average CPU frequency is obtained and the second pulses can be labelled with appropriate hr:min:sec data from other sources.

When some other event needs to be timed, the TSC counter is read and the elapsed count since the last second marker is calculated. The result is divided by the average frequency and added to the hr:min:sec of the previous second marker (if needed). In this way, much of the overhead associated with hr:min:sec.ms processing is avoided and usually some rounding errors can be avoided.

There are similar problems when using sound cards. The sample rate can be quite far from the nominal frequency and there can be quite a lot of drift and jitter in the sampling frequency. Thus, the sampling frequency must be constantly calculated from the incoming timing data e.g. when receiving 1 PPS signals on the left channel and Loran-C on the right channel to get the accurate timing difference between these signals.

I noticed the inaccuracy of the sound card sampling rate the hard way when trying to synchronise to a Loran-C sequence in order to drive a synchronous front end noise blanker to avoid Loran-C splatter at the 137 kHz LF band.

The nominal Loran-C cycle time was usable mainly to avoid false synch, but in order to get multiple cycles aligning with each other (to integrate and improve the SNR), the actual sample rate was quite different from the nominal and also some fractional samples (calculated from adjacent samples) had to be, since the Loran-C cycle was not an integer multiplier of the actual sampling rate.

This is of course what I meant in my post with "reading the microsecond
or nanosecond clock". In Linux there is a counter that is incremented
every 10ms and together with that TSC counter it can provide a good
timestamp to be processed in the usermode task that locks the PLL.

There is almost no overhead at interrupt time, but you should consider
the interrupt latency of the system, which can cause the interrupt to
be serviced later than the actual pps pulse occurred.

Indeed, this has all little to do with soundcard processing, which has
other problems.

That depends on the TV station. There are some (government) TV stations here in Europe that use a very high precision frequency reference and/or have locked it to an official standard provided by (government) weight and measures boards. And other (commercial) stations that don't consider this worth the trouble. So you need to check first.

Of course, this provides only frequency reference, not time.

Howdy!

The original script used for the discussion Forum at USPN had a few bugs and security problems, and eventually I threw my hands up and decided to go with different software. Yesterday I installed Ikonboard, which QRZ.COM has had good luck with.

The new USPN forum is nice, but unfortunately, all original posts and user data was lost in the upgrade. At that time, the web site had been online for about five weeks, had 71 members on the Forum and had recieved over 5,000 "hits" during that five-week period. The site got a nice write-up at the ARRL web site, and links to it have appeared at several web pages devoted to amateur packet radio networking.

Now that the problems with the Forum script have been resolved, I am looking for Elmers to keep an eye on the various Support Forums, and help out hams who have questions there. I can do allright for hams on the FlexNet support forum, for example, but am not knowlegable enough to help out hams on the ROSE/FPAC or X1J/NetRom/BPQ forums. The best I can do there, is to point them toward other sources of information. Obviously, those forums would be much more useful if they had somebody in there who knew the subject matter better than I do.

The USPN web site is just a web site, and there are thousands of those... What makes it special are the people who visit or hang out there.

So I am making a call for volunteers. Check in there every once in a while, and see if you can help somebody out! I am looking for Elmers who will do this on a casual basis, but I am also looking for hams who would volunteer thier time to a particular support forum at USPN and take over the responsibility of moderating that discussion. The "try-outs" for those positions at USPN will occur on the support forums. Do a good job there, show up regularly, and I'll be pestering you to officially join the USPN staff as an Elmer/Moderator.

I have recieved offers of financial support for USPN, but to be honest, it doesn't cost an awful lot to run that site. Keep your money, because what is really needed is a little bit of your time.

USPN is dedicated to amateur packet radio networkers in the USA, hams who step aside from the various discussions of theory long enough to go out there and build network. This applies to individuals who run a single node, just as much as it applies to packet networking organizations that have dozens of nodes covering several states, and the digital HF operators whose efforts tie the various VHF/UHF networks together.

Since putting the site online, I have heard from many hams and networkers. I originally thought that I would be showcasing the efforts of just one or two remaining digital groups, but I have since found out better! There are viable, active, growing packet networks all over the United States, and thousands of hams out there who are dusting off their TNC's and warming them up again, in order to see what kind of activity is in their area. Not only is packet in the U.S. coming back to life again, but it turns out that rumours of the U.S. packet network's death were greatly exaggerated!

A lot of hams have helped me out with the USPN site, letting me know about interesting links and making suggestions about the site that have turned out to be very useful. I could still use some help in that area, but what I would most like to see are some volunteers who will oversee the activity on some of the support forums.

Also: Not all of the packet networking groups have web-sites, and so are not listed at USPN. If your network is not represented on the web, just send me some information about your network along with the adderess\addresses of a contact person, and I'll be glad to list your network on the USPN Network page.

Tell us about your network!

USPN: http://www.uspacket.net

I've found the site http://www.relisoft.com to be very good. It provides source code for an audio FFT analyser and explains the working of the modules within the project.

Hope you find this to be of help.

Please help me think through the use of Amateur Radio for connectivity to the Internet or to get EMail. This was somewhat prompted by KH6TY's OpEd piece in the September, 2002 QST.

I have heard of people who get their Amateur Radio licenses mainly so they can use WinLink or similar ham radio networks to get their EMail while travelling (sailing, RV's, etc).

Some of these people probably aren't radio hobbyists per se, they are mainly interested in using ham radio as an alternative to paying for a commercial wireless email service. This is actually a violation of the FCC regulations. Under Part 97.113 paragraph 5 says that "No amatuer station shall transmit ... Communications, on a regular basis, which could reasonably be furnished alternatively through other radio services."

On the other hand, as amateurs, we need to experiment and keep up with advances in technology such as digital networking. In order to test our developments and ensure that they will work as backups in a communications emergency, we need to operate such networks under somewhat 'real world' conditions and these users provide that kind of testing.

Without usage of the frequencies by such networks, we run the risk of losing our frequency allocations. Also, some of the people who get an amateur radio license for this purpose may eventually move into more traditional usage of ham radio.

I suppose similar arguments could be made of much of the PSK31 traffic and SSB communications where people get on to talk to friends, but at least that is communication between hams. In the traveling email scenario, much of the communication is third party traffic.

Just some thoughts / questions
Mark

Has anyone out there used the MFJ 1278 B and Multicomm v1.6.2 to work PSK31. I purchased this software and the soundcard interface cable along with the tnc from MFJ. The software always ends up locking up when in soundcard modes. I've tried it using Microsoft XP and also ME. I've tried it with Soundblaster card and onboard sound. I've tried every possible configuration. I currently am running it on a Compaq Presario 1.6ghz box with 512 mb ram. Every computer I've run it on it uses 98% or better of the processor and ends up crashing. I'm not getting any help from the programmer. Let me know your experience with this software/tnc combination.

TIA,

Loy Bean

Have you tried any other softwear to see if it will work ?

Loads of very good free stuff here.

Ralph,

I am interested in the MFJ interface. I know I can use other software with probably better results. But, I am interested in the version software and hardware I mentioned from other possible users. Thanks anyway.

Loy

Can anyone provide information on how to configure WinAPRS to work with the
Kenwood TM-D700 and it's built-in TNC, or point me in the right direction?
I'm stumped.

1. Put the TM-D700 into "TNC PKT" mode (see the manual).

2. In WinAPRS, set the baud rate to 9600, and I think you will find
there is a Kenwood or TM-D700 TNC type that you can select.

That's what I've been trying, but when i try to "open" the TNC, it keeps
failing. It's weird.

Not sure by what you mean by "controlled", but I have been using my PocketPC
and a terminal program to "talk" to my TNC. I am in the process of working a
PocketPC CAT for my FT-817.

Hallo!

I'm looking for schematics for an easy to build simple Transmitter for 20 m.
I want to take it on holiday for PSK31. So it can be on the fixed frequency
14.070 MHz.
I know that there are schematics for such a device out there - but I didn't
find it.

Thank you very much!

Failing in what way? I thought WinAPRS would "open" the TNC even if
there wasn't a TNC connected.

Try connecting to the TM-D700 from a terminal program - HyperTerminal or
whatever - and see if you can communicate with the TNC.

(Presumably you are using a straight-through cable?)

I doubt their numbers are very large. "Airmail" is HF, requiring a
General or higher class license. There are missionaries who got licensed
in order to carry out church business but the number is noise level. I
suspect it's the same with email.

Please tell me more about these wireless email services. I'm looking
forward to some extensive travel in a few years and 'airmail' is
typically limited to some 300 baud.

Given this rule, whuffo FCC allows autopatch on repeaters?

Our views of Amateur Radio differ. I see the spectrum as a piece of
public property, parceled out to various users by the FCC to prevent
chaos. Portions of it, including the amateur bands, have been designated
for recreation just as some federal lands are set aside for parks, etc.
For some, the enjoyment we get from this comes from experimentation, or
from providing public services but others derive theirs from rag chews,
contesting, et al. The only 'sin' is failing to have fun!

Mark:

I agree with your views.

My own view of the amateur radio spectrum is similar to my view of the National Parks, with the FCC in the role of the Park Service.

The spectral space represented by the ham bands is set aside for the enjoyment of the citizens and for the protection and preservation of a certain percentage of spectrum from overdevelopment by commercial interests.

The entry "fee" into the "Ham Bands National Park" is simply the effort required to pass the test and get an amateur radio license.

And the only "sin", as you point out below, is the failure of those authorized visitors to the park to enjoy themselves and have fun.

In the national parks one can enjoy themselves by, driving, sightseeing, camping, hiking, fishing, canoeing, hunting, photography, mountain climbing, airboat riding, etc... In the ham bands one can enjoy themselves by: operating, rag-chewing, contesting, DXing, data networking, image communications, EME, etc... designing and building equipment, testing equipment, experimenting, public service, etc...

The only invalid uses of the "Ham Bands National Park" are those that involve: destruction of the habitat, grafitti, littering, commercial exploitation, etc...

I should have remembered the 1278 was not just a sound card interface like the Rig Blaster, but a TNC. I was just thinking you might try another program just to see if the sound card interface was working or if it was the Multicom program giving the problem.

Whatever your own view might be, here is the reality.

S 97.1 Basis and purpose.

The rules and regulations in this Part are designed to provide an amateur radio service having a fundamental purpose as expressed in the following principles:

(a) Recognition and enhancement of the value of the amateur service to the public as a voluntary noncommercial communication service, particularly with respect to providing emergency communications.

(b) Continuation and extension of the amateur's proven ability to contribute to the advancement of the radio art.

(c) Encouragement and improvement of the amateur service through rules which provide for advancing skills in both the communications and technical phases of the art.

(d) Expansion of the existing reservoir within the amateur radio service of trained operators, technicians, and electronics experts.

(e) Continuation and extension of the amateur's unique ability to enhance international goodwill.

And some of us oldtimers HAVE supplemented our old, cherished ways of passing traffic and have set up an NTS digital network using pactor http://wb0taq-twn.home.att.net/ntsd.html We pass NTS traffic to all corners of north america every day, digitally.

This is a bit off the topic of packet (since it's based on pactor), but I thought Gary should know that some of us have invested time and (dare I say it) money to nudge NTS into (at least) the 20th century. :-) And several of the pactor MBO's are also tied to vhf packet networks, eg KW1U and K1WU.

A couple of years ago I went to the Creative Labs website and
downloaded a complete programmers reference. It contains everything
you need. I just did a quick look on their website and couldn't find
it. When I get home I will look to see if I have an electronic
version of it (I know I have the hardcopy).

I'm looking to hook up my HP 320 LX into a PSK31 station with a PCMCIA
soundcard, a rigblaster or equal, and then my ICOM 706.  This will be a very
```

small mobile PSK31 station. Has anyone tried this?? If so, some questions:

What software did you try and what were the results??
What PCMCIA Sound Card did you try and what were the results??
Any suggestions??

I know the HP 320 LX is a great little packet computer but, I want to try and go for something a little more useful.

Any help is greatly appreciated.

Hello, Paul -

I very much doubt that the 320 is up to the task. All the PSK31 software I know of is written for Pentium architecture computers. The HP320LX CPU is a Hitachi SH-3 running at 44MHz. It can't run software written for regular Windows or DOS machines (i.e. 80x86 based). And I'd very strongly suspect that it doesn't have the speed to do the digital signal processing that PSK31 software demands.

The limitation isn't the soundcard. The software does a tremendous amount of computation for each sample of the sound (at least 8000 times a second, sending or receiving). With its built-in floating point hardware, superscalar integer processing, and high clock rates, a capable Pentium, Pentium 2, Pentium 3, Celeron, etc. can keep up. The SH-3 is a fine chip but nowhere near the same performance.

If there was such a thing as a PSK31 'TNC' you'd only need the 320 to act as a serial terminal (which software is built in). But with the setup you describe, you're out of luck.

No, I can't prove it's impossible - and I hope someone shows me wrong! But having dealt with digital signal processing since '75, SH-3 HHCs since '98, and such, I won't hold my breath.

Sorry about this!!!

Jim Horn, WB9SYN/6

You'll need a SSB transmitter of some sort and that rules out the simple part.

"don't not"? A double negative means you HAVE a rotator?

PSK31 is transmitted using audio tones modulating a SSB transmitter.

Gary

Not necessarily. Because he only needs to cover a few KHz of the 20M band, he could generate the carrier at signal frequency and remove the opposite sideband with a simple crystal ladder filter. The good news is that it is very simple, the bad news is that he will have to buy several 14.070MHz crystals.

This is quite easy to do on 80M because the PSK31 calling frequency is very close to 3.579MHz. You can use cheap colour (or should that be color for NTSC) TV crystals.

Loy

I've been in contact with you about all these issues, as well as having MFJ
try to replicate them. Saying I have been no help is totally misleading.

The 1278B firmware of 06.31.01 has bugs and I've done my best to work around
them. This last weekend I showed them in detail to Steven Pan, MFJ's vice
president.

Continued in private email.

Rick - W4PC

It appears that HamScope and MixW will let you select DTR to directly
key CW (as well as select RTS to key PTT).

What are some of the other RS-232 pins that the other popular
sound-card programs let you select to key CW?

In particular, does any program used TXD to key CW?

I am trying to specify a sound-card interface and want to pick the most common arrangement.

Rick,

Please accept my apology, I should have said I've had no success with the programmer's help in making it work on my system.

Thanks,

Loy Bean
KN4SA

I think Small Wonders Labs has a 20m 5w QRP PSK31 rig.

http://www.smallwonderlabs.com/

Look at the PSK page.

What so special about PSK31 ?

Various forms of PSK are usually generated by I/Q modulators,
essentially a phasing transmitter.

Shouldn't it be possible to have

* a RF signal source (in this case a crystal oscillator or VXO),
* an RF phase shifting network to generate the quadrature carrier
   (simple in this case due to the fixed frequency),
* two modulators (NE602, SBL-1 etc.),
* baseband filters for premodulaton shaping
* a linear power amplifier (due to premodulation shaping)
* a digital signal source (PIC, PDA, PC etc.)

to generate various sorts of PSK signals, not just PSK31 ?

Yeah, but a very simple fixed tuned SSB transceiver like the PSK20 ($95 kit, $140 with custom cabinet, size of a modem, requires 2A at 12V from a wall wart or battery, makes 5 W PEP) works with a PC with sound card.

With software like Digipan you can "tune" anywhere in the audio passband (think of it as a tunable IF with digital filtering and software demodulation), which covers the entire area of interest between14.070 and 14.073. The PSK is generated and decoded in software on the sound card equipped PC.

With software like WinPSK, you can even monitor several different transmissions at the same time, and reply to any one of them with just the click of the mouse on the waterfall spectrum display. Very convenient.

If you want a different PSK modulation (or even a non-PSK modulation), there is software available to do that too using this same hardware system. All you do is load a different program. Write your own if you like.

I carry my PSK20 in my laptop bag when I travel. I can be setup to operate a couple minutes after I rig an antenna. (I usually use a simple wire dipole and a tiny MFJ tuner.)

This is pretty much a software defined radio. Many of the functions normally done in hardware are done in software at "IF" by the sound card equipped PC.

Ken,

I think you'll find that most programs use DTR or RTS for CW keying or PTT. I've not seen any programs that use TXD for CW or PTT, and from my understanding of the serial port hardware, I don't think that you will. You will find RTTY programs that use TXD to key the FSK line.

I don't think there is any standard on the use of DTR or RTS. Many programs let you select which line to use, but I've run across at least one that didn't. To be most flexible, you may want to put a couple of SPDT switches in the line between your computer and your digital interface. That way you can select whichever line the particular program requires. Also, if you use a switch with a center off position, you can use that as an emergency shut down should your computer lock up with PTT or CW enabled. I've also noticed that during the boot up process, the computer briefly enabled DTR and RTS (I suspect while determining serial port properties) so if my radio is on it gets keyed unless I have the interface switch off.

73,
Mark

Thanks for your response. Yes, that is what I found when I did more research after the posting (in the help file for MMTTY).

I have not yet gotten to playing with RTTY, so I am unfamiliar with
its nitty-gritty details. One question that did present itself was,
Why bother hard-keying FSK RTTY using the TXD pin when almost every
sound-card program has an AFSK mode?

I can see hard-keying CW, because you enable your radio's QSK mode and
because SSB-simulated CW is not really CW. But an AFSK RTTY signal
ought to look just like an FSK RTTY signal, No?

While a perfect AFSK signal should be identical to an FSK signal, there are a couple of reasons for using FSK. Actually a perfect soundcard CW signal should also be identical to a 'real' CW signal, with the QSK exception you mention.

1) The operative word above is 'perfect.' With FSK, the transceiver ensures that the level is proper. With a soundcard, it would be possible to over or under drive and distort the signal. Also unwanted frequency components (60 Hz hum) in the input could be transmitted. An active speech processor could also distort your signal.

2) With AFSK, SSB is used to transmit. On many radios, the narrow receive filters are not selectable in SSB modes, but may be in FSK mode.

3) The FSK output takes less processing on the computer. This is only an issue if you're trying to use an old computer, which probably isn't going to run Windows all that well anyways.

4) It gives the RTTY (or FSK) button and input on your transeiver something to do <g>.

Mark

Of course. I plan to put such a system together this
winter - baseband I/Q out a PC sound card, then an
RF modulator and power amplifier. With such a setup
you can generate just about every form of modulation
hams use today.

This is incompatible with ricebox technology, so I
doubt anybody else will be interested in it.

I thought that a USB modulated CW signal is roughly the top 1/3 of a
sine wave, with the rest truncated off, giving a wave pattern with
flat bottoms and rounded tops. Have I improperly extrapolated the
explanation for dummies?

Mark, if you want to use HF to send and receive email,
check out the winlink.org website. You can download the
airmail2000 software and do email that way. Read and
follow the rules posted by the Winlink sysops and system
administrators. Don't be discouraged by the dinosaurs
who say that email on ham radio is illegal.

Hello. Am contemplating trying PSK-31 with a Toshiba 1405 laptop
which has only mike-in and earphone-out levels. Does anyone know,
or can anyone point to a discussion that's already happend, if
programs like DigiPan, WinPSKse, and WinWarbler will find the
"necessary hardware" in such a laptop to make PSK-31 work?

If it's only a matter of impedance matching (the Toshiba has
mike-in and earphone-out levels, not line-in and line-out) then
i can try to tweak my Rascal interface. But if the software isn't
going to find the correct hardware inside the laptop, that's a
different problem, right?

Thanks for any comments. Orrin WN1Z

Anyone succeeded at doing PSK-31 with a Creative Labs 'outboard'
USB sound blaster? It plugs into a USB port. It is made by
Creative Labs. Goes for $149.95 or so.

I hope you have a sound card that has a frequency response down to DC.
At least some CODECs have some kind of offset compensation (similar to
auto-zero in DVMs) at the analog input, thus, the analog input behaves
as if it contained a high pass filter around 3 Hz.

>This is incompatible with ricebox technology, so I
>doubt anybody else will be interested in it.

I have often wondered, why baseband I/Q (zero-IF) modulation and
demodulation has not been used more frequently in amateur digital
systems. Just look at the large number of I/Q chips available from
e.g. Maxim.

I use the Yaesu FT-1500M. You can get them for a little over $100 now and they can go up to 50 watts, are built real well and that's what I use on APRS (WB8NUT-12).

Up to now I've always used my KPC-3 on 2m. I recently purchased a Yaesu FT-100D and was wondering if the TNC can be used on other bands as well. There doesn't seem to be any discussion on that in the manual.

Should be no problem. The Windows drivers for the sound card take care of the details. I used PSK31 on a Toshiba 310CDS for a year or two a while ago, along with SSTV, Hellschreiber, MT63 etc.

You have. Consider that a SSB transmitter is just an up converter, which shifts an audio tone to an RF frequency. If you tune the radio to 14.070 and feed it a 1 kHz audio tone, what you get out is an RF carrier at 14.071. If the 1 kHz tone was a nice clean sinewave, so will be the 14.071 carrier. If the 1 kHz tone is PSK modulated, so will be the 14.071 carrier. Etc.

What you're picturing is the time domain envelope of a double sideband with carrier (ordinary AM) transmitter modulated by a tone. If you were to view that signal in the frequency domain, you'd find three distinct frequencies, a lower sideband at 14.069, a carrier at 14.070, and an upper sideband at 14.071. In the time domain, these three separate signals produce the waveform you're picturing.

If you diode rectify that, and pass it through a low pass filter, you'll recover the original audio.

In a SSB transmitter, the carrier is suppressed by the balanced modulator, and the lower sideband is suppressed by the filter, leaving only the upper sideband. In the time domain, that looks completely different. It is simply a faithful replica of the original audio tone translated to a much higher frequency.

Diode rectifying and low pass filtering this would just give you a DC signal. But if you *mix* (product detect, frequency translate, they all mean the same) a locally generated 14.070 signal with the received 14.071 signal, and low pass filter that, you get the original audio tone back. That's how a SSB receiver works.

(There's usually an IF conversion or two in there, but that's irrelevant to the basic idea that SSB signals are simply frequency translated audio signals.)

Yes, those programs will work. They communicate with the sound
card via calls to the Windows sound interface (API). Any Windows
compatible sound card looks the same to a program accessing
it via the Windows API. (That's why programmers are supposed
to access sound cards that way.)

>If it's only a matter of impedance matching (the Toshiba has

It is more a matter of matching levels than matching impedances,
though to an extent it amounts to the same thing. You'll have to
pad down the signal going to the mic-in port, and you may need
to amplify the signal coming out of the ear-out port (though if you
feed it to mic-in on the radio it'll probably be strong enough).

Hank Oredson wrote:

> Hmmm ... so our 9600 baud network doesn't exist?
> Darn! I was having so much fun with it just an hour ago.
> .

snort 9600. thats a f-kin joke. Even if there were enough 9600 nodes and
access points to justify calling it a 9600 network its still a laughable
baud rate.

Im a ham, but i dont use packet anymore really. 1200 was cool in the 80s
it rivalled POTS modems and was free compared to the pay-per-min net
access. however 9600 in 2002 does not equate to 1200 in the 80s. 56000 bps
reliable world-wide communications serves all my information needs, all my

email needs, same for newsgroups mailing lists, etc, etc. Theres nothing for us on packet that there isnt on the net information-wise. It can now only have two selling points - innovation and experimentation and offering somthing BETTER than the net. It will NEVER hold more information. Here are the problems with packet as i see them :

1. The access points are two slow.

We could easily do 128 Kbps on 70cm, provided it was a 1/2 duplex system where many access users used the same freq in an 'ethernet' type setup. Custom hardware for this could have rx/tx switching times such as round-trip times from user to user could be kept in the order of a couple of hundred ms if not less. In the UK there is ~ 1Mhz of bandwidth in 70cm that could be used for this without interference to existing allocations.

Also 23cm has 7 channels at 150Khz wide already allocated for high-speed packet. Having the bandwidth to do it is not a problem, the equiptement can be cheap, the power reasonably high and the distance from access points 10s of miles. 13cm possible too packet allocations with 200Khz and 1Mhz b/w.

I totally agree that we must move away from the illusion that regular rag-chew hardware will do the job. Custom hardware for the access points could be homebrewed of mass-produced for ~ 100 UK pounds.

2. 9600 duplex for the backbones is stupid. Try somthing in the region of 10Mbps duplex, what about the all modes section in 9cm. space for LOADS of these link side-by side. 10Mbps would be only a beginning. REAL backbone links, international links should be looking in the order of 100Mbps upwards. The bandwidth *is out there* for multi-megabit duplex backbone links on: 13cm, 9cm, 6cm. Duplex base-band transceivers are availible on these frequencise (mfrd often for ATV use), can be brought or made for a negligible cost - simply waiting to be plugged into the AUIs of eithernet cards.

3. AX.25 - ditto my comments on 9600 for backbones. Just forget it. and no dont even piggy back IP on top of ax25. Industry standard ethernet-over-wire protocols are the way to go for the backbone and access points.

4. We need connection to the outside networks, whether by telephone (Voice over IP) or internet. Simple change to the liscence, so long as its not for commercial use would be fine.

5. We also need to forget DOS bbses, KA9Q or whatever else you're using now. Standard ethernet interfaces on Linux, BSD, Unix for the links. Standard serial or ethernet comms for the access points.

5. The IP address co-ordinators need to start putting their phone numbers on the list so that ppl looking for a 44. IP can actually get one. *hint* ;)

And before anyone asks, I AM liscensed and fully paid up ham, and no this is not vapour. If anyone doubts this - just give me the money and i will build you these links access points etc. Someone really does need to do this, get a bit of money together to develop these ideas into real products (probably cost a few thousand quid and a few hundred hours of work for the initial development) and then get a few ads for them placed in the magazines.

Untill this happens, or someone asks for my help in making this happen, or someone offers me a grant to make this happen, im staying off packet and on my 56K..

Xeno.

There is still a useful application for 1200 baud packet...its DX Packet Cluster.

The clusters themselves are internet connected, the radio is used just locally, and only by a limited number of users, say 6 max. In that configuration it's fast enough.

I have radio connected users at 1200 who stay connected for weeks at a time and get just what they want.

This configuration has replaced our radio network, and for our purpose, DX spots it's just fine.

Configuration details at http://dxspots.com

It can be used with any radio, however the KPC-3 is intended for use on VHF. If you are wanting to use it on frequencies lower than 2 meters, you will want a tnc that can go to 300 baud with the proper modem tones. Per page 25 in the KPC-3 manual (version 5.0): "Although the KPC-3 can operate 300 baud, the modem tones will still use a 1000 Hz shift whereas most HF packet uses a 200 Hz shift."

In fact there are quite a few applications that run well on 1200 bit/s, such as APRS and DX-clusters. It is also sufficient for ad-hoc networking in emergency situations as a replacement of CW/phone message transfer. Practically any radio can be used, which is a bonus in an emergency.

There is no real benefit of going to 9600 for these applications, there no need for higher speed, but the number of available radios is reduced.

Unfortunately half duplex 9600 bit/s is not really sufficient for interactive applications such as remote access (e.g. telnet) or web browsing (lynx on other text based browser). The real problem is the high latency, not the data rate itself.

So what is the real use of 9600bit/s ? Flooding the same bulletins to all BBSs at a greater rate ?

>that could be used for this without interference to existing allocations.

Most RF-paths used by hams are not nice clean LOS paths, so multipath has to be considered. It distorts the baseband signal waveform, especially at high data rates. When using narrow modulation methods such as 2FSK, 2PSK, 4PSK in order to save spectrum, the selective fading (caused by multipath) may completely knock out the channel and no amount of FEC will help.

In order to avoid selective fading, most robust high speed digital systems widens the frequency band used. In many cases multiple signals are multiplexed on a common wide frequency band e.g. in GSM cellular phones (TDMA) or in the DVB-T multiplex (COFDM). Multiplexing would not be practical for hams due to the large amount of coordination needed, but spread spectrum might be a good alternative, since it does not need coordination. However, finding a 1-2 MHz frequency band for all packet signals could be hard at least on lower bands.

Latency could be reduced if the system operated full duplex in a cross band mode.

>2. 9600 duplex for the backbones is stupid.

The idea of using long _multihop_ backbone links is justifiable in countries in which it is forbidden to connect ham transmitters to the wire networks. In other countries, the same human and equipment resources could be better used for the RF-link to the end user and to develop various applications. The long distance HF links are of course a different thing, unfortunately the available throughput is quite low.

>Try somthing in the region of
>10Mbps duplex, what about the all modes section in 9cm. space for LOADS of
>these link side-by side. 10Mbps would be only a beginning. REAL backbone
>links, international links should be looking in the order of 100Mbps

>upwards. The bandwidth *is out there* for multi-megabit duplex backbone
>links on: 13cm, 9cm, 6cm.

One problem here is the low ham density in most parts of the world, so it would be hard to find suitable places for intermediate links. While 2m/70cm links running 1200 can be quite long and work reasonably well at extended distances, long distance microwave systems require shorter links and nearly line of sight paths and thus a large number of intermediate stations.

Yes, I am aware that microwaves propagates quite well for short distances (hundreds of meters) within an urban area and narrow band microwave signals can propagate every day several hundred kilometers by troposcatter by using sufficient amount of effective radiated power (several kW), but nighter case applies to high speed backbones.

>3. AX.25 - ditto my comments on 9600 for backbones. Just forget it. and no
>dont even piggy back IP on top of ax25. Industry standard
>ethernet-over-wire protocols are the way to go for the backbone and access
>points.

X.25 was designed for full duplex landlines with relatively low bit error rates. Trying to adopt this to the radio environment with usually much higher bit error rates, which caused a lot of retransmissions, which is very costly due to half duplex operation and high Tx/Rx turnaround times.

This either significantly drops the effective data rate or requires a very high SNR, which means higher transmitter power, bigger antennas or reduced link spans, compared to using some protocol designed for radio use.

A good radio protocol should use some form of interleaving to spread out burst errors into random errors (although using spread spectrum will reduce the burst errors due to selective fading), sufficient ECC should be applied to correct at least a modest number of bit errors without a retransmission. Retransmissions will significantly reduce the throughput and increase the end to end latency, especially if a half-duplex link with slow turnaround is used, thus, retransmissions should be avoided at all cost.

Good luck. I tried changing my I/Q system to use
a sound card and PC to replace the DSP evaluation
module. I never could get phase synchronization
between the I and Q samples. (The sound card
operates sequentially for left and right, and you
can't precisely control the timing.)

That's why I gave up on that approach and simply do the modulation of the carrier while still in the digital domain. Then one channel of the sound card is used simply as a D/A to output the modulated signal at an audio IF. That goes to a conventional SSB transmitter for up conversion. That gets rid of all the uncontrollable timing problems.

There have been a number of articles in the QRP Homebrewer and QQ, if I recall, on simple PSK rigs. You might check the NJQRP site, http://www.njqrp.org, most probably there are schematics of an 80 meter PSK rig that could give you ideas.

Also, you might check the DL-QRP club at http://www.werdau.net/dl-qrp-ag/. The transmitter circuit from their Black Forest rig might be pressed into service. I'm not a German speaker but it appears there is more on their German language pages than their English pages so there may be something else there useful, as well.

You might also try emailing Peter, DL2FI, who is the engine behind DL-QRP. He is one heck of a fun guy and a bundle of ideas. (Also a recent inductee to the QRP Hall of Fame).

I bought a Rascal for my FT990 radio and am enjoying it. The price is very very right but I had to commit to DSR to key PTT and DTR to key CW. Buck won't do a third switch, so I can't have TXD key RTTY.

This started me looking at the other adapters (RigBlaster, MFJ) but I couldn't find one that was general, easy to use and cheap. I think I am looking for one with only RCA jacks as ports, like the Timewave 599zx kind of does.

Sound card in and sound card out could be done with hardwired stereo phono plugs on 5 ft cables, since I have never seen a sound card that took anything else.

For the rest, RCA jacks for:

Radio AF in
Radio PATCH out
TXD in (with LED)
DTR in (with LED)
RTS in (with LED)
PTT out (maybe a few of these)
CW key out
RTTY SHIFT out

Then I could make cables with a few RCA plugs on one end (and RTTY DIN, DB-9, CW phone plug, mini phone plug, MIC, etc., on the other end) and plug the RCA plugs in where my software requires.   This beats opening the unit up and changing jumpers every time you run an oddball program or a hardwired setup (like the Rascal) that works with some programs and not others.

Also, how about an 8-pin MIC thru-adapter that takes inputs from the interface, but also lets you plug in your microphone, so you can do phone without unplugging?

Has someone already done this? Am I all wet?

Where can I buy the gear?
How much?

> 5. The IP address co-ordinators need to start putting their phone numbers

> ;)

The local address coordinator has not been on air at least
since I moved here in 1989.

> And before anyone asks, I AM liscensed and fully paid up ham, and no this

So do it. Make a bunch of money.
Or is it the usual hot air and no action babble?

> Untill this happens, or someone asks for my help in making this happen, or

> on my 56K..

Ah ... I see ... you can't do it.
I've been asking for these products since 1986.
Why can't I buy any?
Because the folks that claim it is "easy" are unable to actually do it.

Not 3000 miles from here :-)
Use Google.
